|                     | EV"@JP1IM_CHANGE_SEVERITY"   | New severity level flag <ul style="list-style-type: none"> <li>• Severity is not changed: 0</li> <li>• Severity is changed: 1</li> </ul>                                                                              |
|                     | ACTHOST                      | Value of the manager host name <sup>#3</sup>                                                                                                                                                                          |
|                     | EVENV1 to EVENV20            | Data obtained by specifying parantheses ( ( ) ) in a regular expression in the specification of an event condition <sup>#5</sup><br>(applicable only when an extended regular expression is used at the manager host) |

#1

The basic information of a JP1 event is converted to the following format and passed to the message after the change (Δ indicates a single-byte space):

*event-ID Δ event-source-user-name Δ event-source-user-ID Δ event-source-group-name Δ event-source-group-ID Δ event-source-event-server-name Δ event-source-process-ID Δ event-registration-date Δ event-registration-time Δ event-source-host-IP-address*

An item that is not set is replaced with the null character.

#2

This attribute value is converted using the time zone set for JP1/IM - Manager and is passed to the message after the change.

#3

When the message is changed, if the applicable attribute does not exist, the variable is converted to a null character and passed to the message after the change.

#4

When detailed attribute information for a JP1 event is in binary format, the variable is converted to a null character and passed to the message after the change.

#5

If the applicable attribute does not exist, the character string of the variable is passed as-is to the message after the change.

### Notes about specifying variables

- If you want to specify \$ as a character, specify the escape character \ before the \$.
- If you specify a character, such as an alphanumeric character or an underscore ( \_ ), immediately after the variable name, the variable will not be converted correctly. In such a case, enclose the variable name in curly brackets ( { } ), as shown in the examples below. These examples assume that 100:0 is specified as the event ID (\$EVID) and ABC is specified as the extended attribute EX (\$EV"EX").

Examples:

*display-message-change-definition -> information-after-conversion*

\$EVID abc -> 100:0 abc

\$EVIDabc -> \$EVIDabc

\${EVID}abc -> 100:0abc

\$EVID\_abc -> \$EVID\_abc

\${EVID}\_abc -> 100:0\_abc

\$EV"EX" abc -> ABC abc

\$EV"EX"abc -> ABCabc

- If a non-variable name is specified, no information will be converted at that location. For example, if you specify \$AAA but there is no variable AAA, \$AAA will be set in the message after the change.
- If the value of the attribute specified in EV"extended-attribute-name" or EVENV1 to EVENV20 cannot be acquired, no information will be converted at that location. For example, if \$EV"BBB" is specified but the JP1 event has no extended attribute BBB, \$EV"BBB" will be set in the message after the change.
- If the value of the attribute specified in a variable other than EV"extended-attribute-name" or EVENV1 to EVENV20 cannot be acquired, the variable will be converted to the null character at that location. For example, if \$EVSEV is specified but the JP1 event has no extended attribute SEVERITY, the null character will be set in the message after the change.
- When there is more than one event condition that uses a regular expression, and when there is more than one set of parentheses ( ) in a regular expression, the data captured in parentheses is associated with variables EVENV1 to EVENV20 in a nested sequential manner, proceeding from left to right within each regular expression, and then through each event condition in series.

### Conversion functions for inherited event information

- Inherited event information can be converted into character strings of a user-specified length. This makes it possible to display lists of message IDs, dates, and so on in an easy-to-read format where the data is aligned in a fixed-length field.

If the length of the inherited event information is less than the length specified by the user, single-byte spaces are added to make it the specified length.

If the length of the inherited event information is greater than the length specified by the user, the information is truncated to make it fit the length specified by the user.

When multi-byte characters are truncated, the truncation is performed in such a way that characters are not broken. If the length after truncation is less than the length specified by the user, a single-byte space is added.

Specification format:

```
$variable-name$FIXLEN=number-of-bytes
```

Specify a numeric value from 1 to 1,023 for *number-of-bytes*. If the specification format is incorrect, \$FIXLEN=*number-of-bytes* will be treated as a character string.

By enclosing *variable-name* in curly brackets ( { } ), you can explicitly specify the material to be treated as part of the parameter.

| No. | Specification format          | Character string in \$variable-name | Character string set in message                      | Remarks                                                                                                                                                                                |
|-----|-------------------------------|-------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | \$variable-name\$FIXLEN=6     | ABC                                 | ABC△△△                                               | Because the character string is shorter than the specified length, single-byte spaces are added to compensate.                                                                         |
| 2   |                               | ABCDEFGG                            | ABCDEF                                               | Because the character string exceeds the specified length, it is truncated.                                                                                                            |
| 3   | \$variable-name\$FIXLEN=1024  | ABC                                 | ABC\$FIXLEN=1024                                     | Because the specified value exceeds the maximum value of 1023, it is treated as a character string.                                                                                    |
| 4   | \$variable-name\$FIXLEN=10225 | ABC                                 | ABC△...△5, where △...△ represents 1,019 △ characters | Only the first four characters in the character string after \$FIXLEN= are considered part of the parameter, so the fifth and subsequent characters are treated as a character string. |

| No. | Specification format                          | Character string in \$variable-name | Character string set in message | Remarks                                                                                                                      |
|-----|-----------------------------------------------|-------------------------------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 5   | <code>\${variable-name}\$FIXLEN=10}235</code> | ABC                                 | ABC△△△△△△235                    | The material in the curly brackets ( { } ) through 10 is treated as the parameter, and 235 is treated as a character string. |

Legend: △ indicates a single-byte space

- It is possible to align the number of digits of numerical values to be displayed in the message by padding the value with zeros. This can be used when you want to convert the numeric value representing seconds to a format such as `ss`, `ss.ss`, or `ss.sssss`.

Specification format:

```
${variable-name}$FIXNUM=00.000000
```

You can specify 0 to 2 digits for the integer portion and 0 to 6 digits for the decimal portion.

This conversion is also possible when the value stored in the variable is a character string representation of a numeric value.

When a character string representing a non-numeric value is set, no conversion is performed if the integer portion exceeds the specified number of digits, or the value stored in the variable is greater than or equal to 100.

When the decimal portion exceeds the specified number of digits, the excess decimal places are truncated. Truncation is also performed whenever 7 or more decimal places are set in the value stored in the variable.

| No. | Specification format                             | Character string in \$variable-name | Character string set in message | Remarks                                                                                                 |

| 10  | <code>\${variable-name}\$FIXNUM=0.00</code>      | ABC                                 | ABC                             | No conversion is performed because the value in \$variable-name is non-numeric.                         |
| 11  |                                                  | 0.0000000A                          | 0.0000000A                      |                                                                                                         |

- The number of seconds elapsed since 1970/01/01 is converted to character strings representing the year, month, day, hour, minute, and seconds.

The conversion uses the time zone of the manager host.

No conversion is performed unless the value stored in the variable is a character string representing a numeric value from 0 to 4,102,444,799.

| No. | Specification format                | Conversion                                                                                                                                                                                                                                                         |
|-----|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | <code>\$variable-name\$YEAR</code>  | Converts the number of seconds elapsed since 1970/01/01 to a year.<br>After conversion, the value is output in the format <i>YYYY</i> . The year to be output is padded with zeros as necessary to make it 4 digits.                                               |
| 2   | <code>\$variable-name\$MONTH</code> | Converts the number of seconds elapsed since 1970/01/01 to a month<br>After conversion, the value is output in the format <i>MM</i> . The month to be output is padded with zeros as necessary to make it 2 digits.                                                |
| 3   | <code>\$variable-name\$DAY</code>   | Converts the number of seconds elapsed since 1970/01/01 to a day.<br>After conversion, the value is output in the format <i>DD</i> . The day to be output is padded with zeros as necessary to make it 2 digits.                                                   |
| 4   | <code>\$variable-name\$HOUR</code>  | Converts the number of seconds elapsed since 1970/01/01 to an hour.<br>After conversion, the value is output in the format <i>hh</i> . The hour to be output is padded with zeros as necessary to make it 2 digits.<br>The hour value is output in 24-hour format. |
| 5   | <code>\$variable-name\$MIN</code>   | Converts the number of seconds elapsed since 1970/01/01 to a minute.<br>After conversion, the value is output in the format <i>mm</i> . The minutes value to be output is padded with zeros as necessary to make it 2 digits.                                      |
| 6   | <code>\$variable-name\$SEC</code>   | Converts the number of seconds elapsed since 1970/01/01 to seconds.<br>After conversion, the value is output in the format <i>ss</i> . The seconds value to be output is padded with zeros as necessary to make it 2 digits.                                       |

- Successive format conversion functions can be specified.

If you specify a succession of format conversion functions, the format conversions will be performed from left to right in the order specified.

Even if the previous format conversion fails, subsequent conversion processing is performed.

## Figure 2–11: Successive format conversions

(When character string "5" is stored in `$variable-name`)

Even if the previous format conversion fails, subsequent conversion processing is performed.

(When character string "ABC" is stored in `$variable-name`)

△: single-byte space

### # comment-line

A line beginning with a hash mark (#) is treated as a comment. Note that the comment will be deleted if the display message change definition is set from JP1/IM - View.

## Example definition

If the event ID matches 100 or 200, the severity is Warning, and the source host matches hostA, hostB, or hostC, change the message to A failure occurred in the database server, with the date and time prepended to the beginning of the message.

```
DESC_VERSION=1
def display-message-change-1
  cmt comment1
  define enable
  addflag false
  cnd
    B.ID IN 100 200
    E.SEVERITY IN Warning
    B.SOURCESERVER IN hostA hostB hostC
  end-cnd
  msg $EVDATE $EVTIME A failure occurred in the database server
end-def
```

The following example extracts the message ID and message text portions from the Hntr log.

```
DESC_VERSION=1
def display-message-change-1
  cmt comment1
  define enable
  addflag false
  cnd
    E.OBJECT_TYPE IN LOGFILE
    E.OBJECT_NAME SUBSTR HNTRLlib2
    E.ROOT_OBJECT_TYPE IN LOGFILE
    E.PRODUCT_NAME IN /HITACHI/JP1/NT_LOGTRAP
    B.MESSAGE_REGEX [0-9]{4}%20[0-9]{4}/[0-9]{2}/[0-9]{2}%20[0-9]{2}:[0-9]{2}:[0-9]{2}\.[0-9]{3}[%20]+.*[%20]+[0-9A-Z]+[%20][0-9A-Z]+[%20]+([^\%20)+)[%20]+(.*)
  end-cnd
  msg $EVENV1 $EVENV2
end-def
```

The following example prepends a character string to the beginning of all messages for a particular product.

```
DESC_VERSION=1
def display-message-change-1
  cmt comment1
  define enable
  addflag false
  cnd
    E.PRODUCT_NAME IN PRODUCT_A
  end-cnd
  msg [Product A]$EVMSG
end-def
```

## ◆ Display item definition file for a display message change definition (chmsg\_attr\_list.conf)

### Format

```
# comment-line
attribute-name
attribute-name
:
:
attribute-name
```

### File

chmsg\_attr\_list.conf (display item definition file for a display message change definition)

chmsg\_attr\_list.conf.model (model file for the display item definition file for a display message change definition)

### Storage directory

In Windows

For a physical host:

*Console-path*\conf\chattr\attr\_list

For a logical host:

*shared-folder*\jplcons\conf\chattr\attr\_list

In UNIX

For a physical host:

/etc/opt/jplcons/conf/chattr/attr\_list

For a logical host:

*shared-directory*/jplcons/conf/chattr/attr\_list

### Description

This definition file specifies the items to be displayed in the **Attribute name** display area of the Display Message Change Definition Settings window. The display items specified in the display item definition file for a display message change definition are displayed in the **Attribute name** display area of the Display Message Change Definition Settings window in the order they are specified.

### When the definitions are applied

The definitions take effect when Central Console is started and when the definitions are re-read by executing the jco\_spmc\_reload command.

### Information that is specified

# comment-line

A line beginning with a hash mark (#) is treated as a comment.

## attribute-name

The items to be displayed in the **Attribute name** display area of the Display Message Change Definition Settings window are specified in the display item definition file for a display message change definition. Write one attribute name corresponding to a display item on each line. You can specify from 0 to 256 display items.

Uppercase and lowercase are distinguished. Space and tab characters specified at the beginning or the end of the attribute name are ignored.

When SEPARATOR is specified, a horizontal line such as ----- is displayed in the **Attribute name** display area of the Display Message Change Definition Settings window. SEPARATOR can be used to separate frequently used items from those used less frequently.

However, if only SEPARATOR is specified, only ----- will appear in the **Attribute name** display area. If you then select -----, you will be unable to set the attribute name.

The following table lists the attribute names that can be specified.

Table 2–78: List of display items

| No. | Display item                        | Attribute name           |
|-----|-------------------------------------|--------------------------|
| 1   | Event source host name <sup>#</sup> | E.JP1_SOURCEHOST         |
| 2   | Registered host name                | B.SOURCESERVER           |
| 3   | Event level                         | E.SEVERITY               |
| 4   | Object type                         | E.OBJECT_TYPE            |
| 5   | Object name                         | E.OBJECT_NAME            |
| 6   | Root object type                    | E.ROOT_OBJECT_TYPE       |
| 7   | Root object name                    | E.ROOT_OBJECT_NAME       |
| 8   | Occurrence                          | E.OCCURRENCE             |
| 9   | User name                           | E.USER_NAME              |
| 10  | message                             | B.MESSAGE                |
| 11  | Product name                        | E.PRODUCT_NAME           |
| 12  | Event ID                            | B.ID                     |
| 13  | Destination event server name       | B.DESTSERVER             |
| 14  | Program-specific extended attribute | OTHER_EXTENDED_ATTRIBUTE |
| 15  | Reason for registration             | B.REASON                 |
| 16  | Source process ID                   | B.PROCESSID              |
| 17  | Source user name                    | B.USERNAME               |
| 18  | Source user ID                      | B.USERID                 |
| 19  | Source group name                   | B.GROUPNAME              |
| 20  | Source group ID                     | B.GROUPID                |
| 21  | Object ID                           | E.OBJECT_ID              |
| 22  | Return code                         | E.RESULT_CODE            |
| 23  | -----                               | SEPARATOR                |

### Note:

If an attribute name is specified twice, both specifications are ignored.

If the display item definition file for a display message change definition cannot be read, or the number of valid display items is 0, items 1 to 22 are displayed.

#  
If the user mapping function of the event source host is not enabled, this item is cannot be displayed in the Display Message Change Definition Settings window.

### File

chmsg\_auto\_list.conf (automatic input definition file for a display message change definition)

chmsg\_auto\_list.conf.model (model file for the automatic input definition file for a display message change definition)

## Storage directory

In Windows

For a physical host:

*Console-path*\conf\chattr\auto\_list

For a logical host:

*shared-folder*\jplcons\conf\chattr\auto\_list

In UNIX

For a physical host:

/etc/opt/jplcons/conf/chattr/auto\_list

For a logical host:

*shared-directory*/jplcons/conf/chattr/auto\_list

## Description

This file defines the JP1 event attributes that are set automatically when the Add Display Message Change Definition Settings window opens. The window opens when the user selects it from the **Display Message Change Definition Settings** menu after selecting a JP1 event from the list of events in the Event Console window and selecting **View**. You can also define a default name for the display message change definition.

## When the definitions are applied

The contents of the definition file take effect when Central Console is started and when the definitions are re-read by executing the `jco_spmc_reload` command.

## Information that is specified

# *comment-line*

A line beginning with a hash mark (#) is treated as a comment.

DEFAULT\_NAME *display-message-change-definition*

Specifies the identifier that defines the display message change definition. The identifier must be on the first line in the file (the first line in the file that is not a null line or a comment line).

The display message change definition specified for this parameter is displayed as the initial value when the Add Display Message Change Definition Settings window opens. The window opens when the user selects it from the **Display Message Change Definition Settings** menu after selecting a JP1 event from the list of events in the Event Console window and selecting **View**.

For the name, specify a character string of up to 40 bytes. The permitted characters are all characters other than the control characters (from 0x00 to 0x1F and 0x7F to 0x9F). If a name with more than 40 bytes is specified, characters after the 40th are dropped, and the first 40 bytes of the character string are used as the display message change definition. If this parameter is omitted, `Add display message change definition` is assumed as the display message change definition.

*attribute-name*

For the automatic input definition file for a display message change definition, specify the attribute of a JP1 event that is to be set as an event condition when the Add Display Message Change Definition Settings window opens. The window opens when the user selects it from the **Display Message Change Definition Settings** menu after selecting a JP1 event from the list of events in the Event Console window and selecting **View**. At this time, the condition for the attribute name specified for this parameter will be displayed as the initial value.

For the definition items, write one attribute name of a JP1 event that will be set on each line.

Uppercase and lowercase are distinguished. Space and tab characters specified at the beginning or the end of the attribute name are ignored.

If there are no valid attribute names, the KAVB1952-W message is output to the integrated trace log file, and the default items are used.

If the same attribute name is specified twice, both are ignored, and the KAVB1954-W message is output to the integrated trace log file.

The order in which the attributes are written in this definition file determines the order in which JP1 event attributes are displayed automatically in the **Event conditions** section of the Display Message Change Definition Settings window.

If *attribute-name* is specified incorrectly, the KAVB1953-W message is output to the integrated trace log file, and the attribute name is ignored.

The following table lists the attribute names that can be specified.

**Table 2-79: List of display items**

| No. | Display item                        | Attribute name     |
|-----|-------------------------------------|--------------------|
| 1   | Event source host name <sup>#</sup> | E.JP1_SOURCEHOST   |
| 2   | Registered host name                | B.SOURCESERVER     |
| 3   | Event level                         | E.SEVERITY         |
| 4   | Object type                         | E.OBJECT_TYPE      |
| 5   | Object name                         | E.OBJECT_NAME      |
| 6   | Root object type                    | E.ROOT_OBJECT_TYPE |
| 7   | Root object name                    | E.ROOT_OBJECT_NAME |
| 8   | Occurrence                          | E.OCCURRENCE       |
| 9   | User name                           | E.USER_NAME        |
| 10  | Message                             | B.MESSAGE          |
| 11  | Product name                        | E.PRODUCT_NAME     |
| 12  | Event ID                            | B.ID               |
| 13  | Destination event server name       | B.DESTSERVER       |
| 14  | Reason for registration             | B.REASON           |
| 15  | Source process ID                   | B.PROCESSID        |
| 16  | Source user name                    | B.USERNAME         |
| 17  | Source user ID                      | B.USERID           |
| 18  | Source group name                   | B.GROUPNAME        |
| 19  | Source group ID                     | B.GROUPID          |
| 20  | Object ID                           | E.OBJECT_ID        |
| 21  | Return code                         | E.RESULT_CODE      |

*Note:*

If an attribute name is specified twice, both specifications are ignored.

If the definition file cannot be read, or the number of valid display items is 0, items 1 to 12 are displayed.

#  
If the user mapping function of the event source host is not enabled, this item is cannot be displayed in the Add Display Message Change Definition Settings window.

## Example definition

```
DEFAULT_NAME display-message-change-definition  
E.JP1_SOURCEHOST  
B.SOURCESERVER  
E.SEVERITY  
B.MESSAGE  
E.PRODUCT_NAME  
B.ID
```

## ◆ Environment definition file for events after the display message is changed (chmsgevent.conf)

### Format

```
[logical-host-name\JP1CONSOLEMANAGER]  
"SEND_CHANGE_MESSAGE_EVENT"=dword:hexadecimal-value
```

### File

`chmsgevent.conf.update` (model file for the environment definition file for events after the display message is changed)

### Storage directory

In Windows

*Console-path*\default\

In UNIX

*/etc/opt/jplcons/default/*

### Description

This file defines the execution environment of the function for issuing an event after a display message has been changed. It specifies whether to enable the function.

The required definitions are provided as a model file. To change the settings, copy the model file and edit the copy after renaming the copy to definition file (for Windows: *console-path*\conf\chmsgevent.conf, for UNIX: */etc/opt/jplcons/conf/chmsgevent.conf*).

### When the definitions are applied

The definitions take effect when JP1/IM - Manager is restarted after the `jbssetcnf` command has been executed in JP1/Base to apply the definitions to the JP1 common definition information.

## Information that is specified

[*logical-host-name*\JP1CONSOLEMANAGER]

Indicates the key name of the JP1/IM - Manager environment settings.

For *logical-host-name*, specify JP1\_DEFAULT for a physical host and *logical-host-name* for a logical host.

"SEND\_CHANGE\_MESSAGE\_EVENT"=dword:*hexadecimal-value*

Specifies whether to enable the function to issue an event after a display message is changed.

- 00000001: Enabled (issue an event after a display message is changed)
- 00000000: Disabled (do not issue an event after a display message is changed)

The default value is 00000000 (disabled).

## Example definition

```
[JP1_DEFAULT\JP1CONSOLEMANAGER]
"SEND_CHANGE_MESSAGE_EVENT"=dword:00000000
```

## 2.6 JP1/IM - Manager definition files (Central Scope)

---

### ◆ Host information file (jcs\_hosts)

#### Format

```
IP-address host-name-1 host-name-2 host-name-3 ... host-name-8
IP-address host-name-1 host-name-2 host-name-3 ... host-name-8
:
```

#### File

`jcs_hosts` (host information file)

`jcs_hosts.model` (model file for the host information file)

#### Storage directory

In Windows

For a physical host:

*Scope-path*\conf\

For a logical host:

*shared-folder*\jp1scope\conf\

In UNIX

For a physical host:

/etc/opt/jp1scope/conf/

For a logical host:

*shared-directory*/jp1scope/conf/

#### Description

This file defines the host information that is managed by JP1/IM - Manager (Central Scope).

The host information file is used to specify the host information that is used for automatic generation of a monitoring tree and for Host name Comparison during JP1 event collation processing for changing the status of monitoring objects. The format of the host information file is the same as for the `hosts` file.

If # is specified, any text following # is treated as a comment.

#### When the definitions are applied

The contents of the host information file take effect when JP1/IM - Manager is restarted or the `jco_spmc_reload` command is executed after the `jcshostsimport` command has been executed.

If you use the `jcshostsimport` command to store the contents of the host information file in the host information database, the host names become all lowercase. Therefore, the host names output by `jcshostsexport` are also in lowercase.

The `jcshostsimport` command does not store comments in the host information file.

## Information that is specified

*IP-address host-name-1 host-name-2 host-name-3 . . . host-name-8*

Specifies an IP address from the beginning of the line (other than spaces), and then specifies host names or alias names after one or more spaces or tabs.

The maximum length of the IP address is 63 bytes. IP addresses of IP V6 are not supported.

The maximum length of a host name or alias name is 255 bytes.

You can specify a maximum of 8 host names for one IP address and a maximum of 8 IP addresses for one host name.

If the same IP address is specified more than once, the first IP address defined is effective.

If there is a line that contains only an IP address, an error occurs during `jcshostsimport` command execution.

A host name is not case sensitive. Japanese characters cannot be used for a host name. An IP address can also be expressed in hexadecimal notation.

## Example definition

```
#
# jcs_hosts
#
# Internet Address Hostname
100.100.10.10      samplehost1  samplehost2
```

## ◆ Guide information file (jcs\_guide.txt)

### Format 1

```
DESC_VERSION=1

[EV_GUIDE_number]
NUM=number
EV_COMP_number=attribute-specification:regular-expression
EV_TITLE=character-string
EV_GUIDE=message
[END]
[EV_GUIDE_number]
NUM=number
EV_COMP_number=attribute-specification:regular-expression
EV_TITLE=character-string
EV_GUIDE=message
[END]
:
```

### Format 2

```
DESC_VERSION=2

[EV_GUIDE_number]
NUM=number
EV_COMP_number=attribute-specification:regular-expression
```

```

EV_TITLE=character-string
EV_FILE=guide-message-file
[END]
[EV_GUIDE_number]
NUM=number
EV_COMP_number=attribute-specification:regular-expression
EV_TITLE=character-string=character-string
EV_FILE=guide-message-file
[END]
:
```

## File

The guide information file (`jcs_guide.txt`) to be edited depends on the language encoding supported by JP1/IM. The following table shows the correspondence between the language encodings supported by JP1/IM and the guide information files to be edited.

Table 2–80: Correspondence between language encodings supported by JP1/IM and the guide information files

| OS      | Language type | Language encoding supported by JP1/IM | File to be edited                                                                    |
|---------|---------------|---------------------------------------|--------------------------------------------------------------------------------------|
| Windows | Japanese      |                                       | <code>jcs_guide_sjis.txt</code> (guide information file)                             |
|         |               |                                       | <code>jcs_guide_sjis.txt.model</code><br>(model file for the guide information file) |
|         | English       |                                       | <code>jcs_guide.txt</code> (guide information file)                                  |
|         |               |                                       | <code>jcs_guide.txt.model</code> (model file for the guide information file)         |
|         | Chinese       |                                       | <code>jcs_guide_GB18030.txt</code> (guide information file)                          |
| UNIX#   | Japanese      | Shift-JIS encoding                    | <code>jcs_guide_sjis.txt</code> (guide information file)                             |
|         |               |                                       | <code>jcs_guide_sjis.txt.model</code><br>(model file for the guide information file) |
|         |               | EUC encoding                          | <code>jcs_guide_euc.txt</code> (guide information file)                              |
|         |               |                                       | <code>jcs_guide_euc.txt.model</code><br>(model file for the guide information file)  |
|         |               | UTF-8 encoding                        | <code>/etc/opt/jplscope/conf/jcs_guide_UTF-8.txt</code>                              |
|         |               |                                       | <code>shared-directory/jplscope/conf/jcs_guide_UTF-8.txt</code>                      |
|         | English       |                                       | <code>jcs_guide.txt</code> (guide information file)                                  |
|         |               |                                       | <code>jcs_guide.txt.model</code><br>(model file for the guide information file)      |
|         | Chinese       | GB18030 encoding                      | <code>jcs_guide_GB18030.txt</code> (guide information file)                          |

#: Only files corresponding to the languages supported by the OS exist.

## Storage directory

In Windows

For a physical host:

*Scope-path*\conf\

For a logical host:

*shared-folder*\jplscope\conf\

In UNIX

For a physical host:

/etc/opt/jplscope/conf/

For a logical host:

*shared-directory*/jplscope/conf/

## Description

This file defines guide information about the JP1 events that trigger a change in monitoring object status.

The information specified in this file is displayed in the Guide window of JP1/IM - View.

The maximum size of the guide information file is 1 megabyte.

Format 2 is used to import a user-created TXT or HTML file as the guide-message file and then display it in the Guide window.

If there are multiple matching guide information items, the first item specified in the guide information file is effective.

In Windows, guide information files from version 07-00 of JP1/IM - Manager (Central Scope) can also be read in JP1/IM - Manager version 08-00 and later.

In Windows, guide information files from version 08-00 or later of JP1/IM - Manager can also be read in version 07-00 of JP1/IM - Manager (Central Scope), but the specification `EV_FILE=guide-message-file` under `DESC_VERSION=2` is ignored, and the specification `EV_GUIDE=message` takes precedence. An error results if the file includes neither specification.

If # is specified, any text following # is treated as a comment. Note that a comment cannot be specified after the start tag, attribute information, or end tag. An error results if a comment is specified following the start and end tags. If a comment is specified following an attribute value, that comment is treated as part of the attribute value.

To use \, specify \\. If \ is used in other than \n or \\$, a log is output and the line containing \ is ignored.

## When the definitions are applied

After the guide information file is edited, the definitions in the file take effect when JP1/IM - Manager is restarted or when the `jco_spmc_reload` command is executed.

## Information that is specified

`DESC_VERSION=1 | 2`

Specifies the version of the guide information file. The permitted values are 1 and 2.

If you specify the `EV_FILE` parameter to call a guide-message file, you must specify 2 in this parameter.

If you specify `DESC_VERSION=1`, `EV_GUIDE=message`, and `EV_FILE=guide-message-file` together, the specification of `EV_FILE=guide-message-file` will be ignored.

If you specify `DESC_VERSION=2` and also specify both `EV_GUIDE=message` and `EV_FILE=guide-message-file`, the specification of `EV_FILE=guide-message-file` will take precedence.

#### [EV\_GUIDE\_number]

This is the start tag for the guide information. The information from the [EV\_GUIDE\_number] tag to the [END] tag constitutes a single definition block. Between this parameter and [END], specify a condition for JP1 events that are to be displayed in the Guide window and the message that is to be displayed. The number begins with 1 and increments by 1 up to the number of guides.

The specification in each instance of the EV\_GUIDE\_number tag must be unique. If an invalid character string is specified, a log is output and the corresponding specification is ignored.

If an attribute specified in the EV\_GUIDE\_number tag is not permitted, the corresponding specification is ignored.

#### NUM=number

Specifies the total number of EV\_COMP\_number entries.

#### EV\_COMP\_number=attribute-specification:regular-expression

Specifies an attribute to be compared. Specify this parameter for each attribute that is to be compared. The specification in number begins with 1 and increments by 1. When multiple parameters have been specified and the AND condition among them is completely satisfied, the message specified in the EV\_GUIDE parameter is displayed in the Guide window.

The value specified in EV\_COMP\_number is ignored if it is less than 1 or greater than the value specified in NUM=number.

Express the event ID as 8 digits. If you specify B.ID as an attribute specification for EV\_COMP\_number and you set only the base part of the event ID in the matching condition, you can omit specification of the extended part.

Example:

```
EV_COMP_1=B.ID:00004107:00000000 or EV_COMP_1=B.ID:00004107
```

#### attribute-specification

Specifies an attribute of one the following types:

JP1 event basic attribute: If you specify this type of attribute, use the format B.attribute-name.

JP1 event extended attribute: If you specify this type of attribute, use the format E.attribute-name.

Monitoring node attribute: If you specify this type of attribute, you can use the format T.MONNODEID (monitoring node ID), with the monitoring node ID expressed as 8 hexadecimal characters.

#### regular-expression

Specifies a value of the attribute specified in attribute-specification using a regular expression. For the regular expression, use an extended regular expression. For details about regular expressions, see *Appendix G. Regular Expressions* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### EV\_TITLE=character-string

Specifies the character string that is to be displayed as the title of the Guide window. You can specify this parameter only once between [EV\_GUIDE\_number] and [END].

#### EV\_GUIDE=message

Specifies the character string that is to be displayed as a guide message in the Guide window. If you use HTML tags, you can display the guide message in HTML format in the Guide window (for details about the supported HTML tags, see *Table 2-81 HTML tags that can be used in guide messages* in the description of EV\_FILE). Note that you can specify this parameter only once between [EV\_GUIDE\_number] and [END].

Express the message as a maximum of 10,240 bytes of characters. If the specified message consists of more than 10,240 bytes, the portion of the message in excess of 10,240 bytes is not displayed in the Guide window.

To use \ in the message, specify \\. To use \$, specify \\$. If \$B.*attribute-name*Δ or \$E.*attribute-name*Δ is specified in the message, the attribute value corresponding to the JP1 event attribute name is expanded (Δ indicates a space). The monitoring node ID replaces \$T.MONNODEIDΔ (Δ indicates a single-byte space). If there is no corresponding attribute, the attribute is replaced with blanks.

To use a linefeed code in the message, specify \n.

#### EV\_FILE=*guide-message-file*

Specifies the full path or relative path (from *Scope-path*\conf\guide\ or /etc/opt/jp1scope/conf/guide/) of the file that contains the guide message to be displayed in the Guide window. Note that you can specify this parameter only once between [EV\_GUIDE\_number] and [END].

Express the file name using a maximum of 1,024 bytes of characters. If the specified file name exceeds 1,024 bytes, an error occurs when JP1/IM - Manager starts or the guide message file is called from JP1/IM - View.

When you specify this parameter, you must specify 2 as the value of DESC\_VERSION.

The file specified as *guide-message-file* can have any file name and extension. We recommend that you use a file name that is easy to manage, and that you use the extension .txt if the guide messages are in TXT format and the extension .html or .htm if the guide messages are in HTML format.

Examples: guide001\_AJS2.txt, guide001\_AJS2.htm

#### Guide-message file

Specify in the guide-message file in TXT or HTML format the information that you want to display in the Guide window. The information that you can specify is the same as for EV\_GUIDE in the guide information file. In the case of a guide-message file, you can edit the formatting by inserting linefeed codes.

The contents and syntax of the guide-message file are not checked.

You can store the created guide-message file in any folder. However, when you are operating in a cluster configuration, you should store it in the following folder for purposes of system failover:

- In Windows

*shared-folder*\jp1scope\conf\guide\

- In UNIX

*shared-directory*/jp1scope/conf/guide/

The maximum size of a guide-message file is 1 megabyte. If the file size exceeds 1 megabyte, an error occurs when the guide-message file is loaded from the Guide window of JP1/IM - View.

The table below lists and describes the HTML tags and attributes that can be used to create a guide-message file in HTML format.

Table 2–81: HTML tags that can be used in guide messages

| Tag                    | Attribute  | Description                                                                                                                                                                                                                                                                                       |
|------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTML                   | --         | Declares that this is an HTML text. This tag is mandatory.                                                                                                                                                                                                                                        |
| HEAD                   | --         | Declares the header of the HTML text.<br>This tag is mandatory.                                                                                                                                                                                                                                   |
| BODY                   | --         | Declares the body of the HTML text.<br>This tag is mandatory.                                                                                                                                                                                                                                     |
| A                      | HREF="URL" | Specifies a link-target URL. If a relative path or a URL beginning with mailto: is specified, the integrity of the operation is not guaranteed.<br>The link specified here is displayed in the Guide window (HTML format). Clicking the link starts a Web browser and accesses the specified URL. |
| H1, H2, H3, H4, H5, H6 | --         | Specifies headers.                                                                                                                                                                                                                                                                                |

| Tag  | Attribute                   | Description                                                                                                                                                                                                                                                 |
|------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FONT | SIZE=" <i>font-size</i> "   | Specifies the font size. The permitted values are from 1 to 7.                                                                                                                                                                                              |
|      | COLOR=" <i>font-color</i> " | Specifies the font color. You can specify the following 16 colors:<br>black, silver, gray, white, maroon, red, purple, fuchsia, green, lime, olive, yellow, navy, blue, teal, aqua<br>If you specify any other font color, the operation is not guaranteed. |
| B    | --                          | Specifies boldface type.                                                                                                                                                                                                                                    |
| I    | --                          | Specifies italics type.                                                                                                                                                                                                                                     |
| HR   | --                          | Specifies an underscore.                                                                                                                                                                                                                                    |
| BR   | --                          | Specifies a forced linefeed.                                                                                                                                                                                                                                |

Legend:

--: None

If any other HTML tags are used, the integrity of operations is not guaranteed.

[END]

Specifies the end tag for the guide information.

## Example definition

```
# JP1/IM-CS Guide Information File.

DESC_VERSION=1
[EV_GUIDE_1]
NUM=2
EV_TITLE=JP1/AJS2 Abnormal termination of job A
EV_COMP_1=T.MONNODEID:0000000A
EV_COMP_2=B.ID:00000111
EV_GUIDE=The job terminated abnormally. \nCheck whether an error has occurred on the $E.C0 host.
[END]
[EV_GUIDE_2]
NUM=1
EV_COMP_1=B.ID:00004107
EV_GUIDE=The job terminated abnormally. \nCheck whether an error has occurred on the $E.C0 host.\nAs an example of failure, a job failed at host A due to a memory shortage in the past. Use the vmstat command to check the available memory capacity.
[END]
```

## ◆ Settings file for the maximum number of status change events (evhist\_warn\_event\_xxx.conf)

### Format

```
[logical-host-name\JP1SCOPE\BMS\EVHISTORY]
"EVHIST_WARN_EVENT"=dword:value
```

## File

`evhist_warn_event_on.conf` (used to enable monitoring of the maximum number of status change events)

`evhist_warn_event_off.conf` (used to disable monitoring of the maximum number of status change events)

## Storage directory

In Windows

For a physical host:

*Scope-path*\conf\

For a logical host:

*shared-folder*\jp1scope\conf\

In UNIX

For a physical host:

/etc/opt/jp1scope/conf/

For a logical host:

*shared-directory*/jp1scope/conf/

## Description

This file defines whether a JP1 event is to be issued when the number of status change events exceeds the maximum value (100 events).

When you have enabled this function, a JP1 event is issued when the number of status change events for a monitoring object exceeds 100. The JP1 event that is issued is a warning event whose event ID is 3FB1.

In JP1/IM - Manager that has been installed as a new installation, this function (issuance of a warning JP1 event) is enabled. In JP1/IM - Manager that has been installed as an upgrade installation, the same setting that was specified in the previous version is initially retained.

## When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the `jbssetcnf` command.

## Information that is specified

[*logical-host-name*\JP1SCOPE\BMS\EVHISTORY]

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify JP1\_DEFAULT for the physical host and *logical-host-name* for a logical host.

"EVHIST\_WARN\_EVENT"=dword:*value*

- The value of `evhist_warn_event_on.conf` is 00000001 (JP1 event with event ID 3FB1 is issued).
- The value of `evhist_warn_event_off.conf` is 00000000 (JP1 event with event ID 3FB1 is not issued).

Do not edit this parameter.

For details about the JP1 events, see [3.2.2 Details of JP1 events output by JP1/IM - Manager](#).

## ◆ Settings file for the completed-action linkage function (action\_complete\_xxx.conf)

### Format

```
[logical-host-name\JP1SCOPE\BMS]  
"ACTION_COMPLETE_MODE"=dword:value
```

### File

action\_complete\_on.conf (used to enable the completed-action linkage function)

action\_complete\_off.conf (used to disable the completed-action linkage function)

### Storage directory

In Windows

For a physical host:

*Scope-path*\conf\

For a logical host:

*shared-folder*\jp1scope\conf\

In UNIX

For a physical host:

/etc/opt/jp1scope/conf/

For a logical host:

*shared-directory*/jp1scope/conf/

### Description

This file defines whether the completed-action linkage function is to be enabled.

When the function is enabled, the status of a monitoring object changes on Central Scope according to the JP1 event action status at Central Console.

In JP1/IM - Manager that has been installed as a new installation, this function is enabled. In JP1/IM - Manager that has been installed as an upgrade installation, the same setting that was specified in the previous version is initially retained.

### When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the jbssetcnf command.

### Information that is specified

[logical-host-name\JP1SCOPE\BMS]

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify JP1\_DEFAULT for the physical host and *logical-host-name* for a logical host.

"ACTION\_COMPLETE\_MODE"=dword:value

- The value of action\_complete\_on.conf is 00000001.

- The value of `action_complete_off.conf` is 00000000.

Do not edit this parameter.

## ◆ Definition file for automatic delete mode of status change event

### Format

```
[logical-host-name\JP1SCOPE\BMS\EVHISTORY]
"EVPROCESSED_MODE"=dword:value
```

### File

Use any file.

### Storage directory

In Windows

Any folder

In UNIX

Any directory

### Description

This definition file is used to enable the function that automatically deletes the status change events when a JP1 event's action status becomes **Processed**.

In JP1/IM - Manager that has been installed as a new installation, this function is disabled. In JP1/IM - Manager that has been installed as an upgrade installation, the same setting that was specified in the previous version is initially retained.

### When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the `jbssetcnf` command.

### Information that is specified

```
[logical-host-name\JP1SCOPE\BMS\EVHISTORY]
```

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify `JP1_DEFAULT` for the physical host and *logical-host-name* for a logical host.

```
"EVPROCESSED_MODE"=dword:value
```

Specifies 1 to enable the function that automatically deletes status change events and 0 to disable the function.

## ◆ Definition file for monitoring object initialization mode

### Format

```
[logical-host-name\JP1SCOPE\BMS]
"AUTO_INITIALIZE_MODE"=dword:value
```

## File

Use any file.

## Storage directory

In Windows

Any folder

In UNIX

Any directory

## Description

This definition file is used to enable the function that automatically initializes monitoring objects when a specific JP1 event is received.

In JP1/IM - Manager that has been installed as a new installation, this function is disabled. In JP1/IM - Manager that has been installed as an upgrade installation, the same setting that was specified in the previous version is initially retained.

## When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the `jbssetcnf` command.

## Information that is specified

[*logical-host-name*\JP1SCOPE\BMS]

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify JP1\_DEFAULT for the physical host and *logical-host-name* for a logical host.

"AUTO\_INITIALIZE\_MODE"=dword:*value*

Specifies 1 to enable the function that automatically initializes monitoring objects and 0 to disable the function.

## ◆ Automatic backup and recovery settings file for the monitoring object database (auto\_dbbackup\_xxx.conf)

### Format

```
[logical-host-name\JP1SCOPE\BMS]
"AUTO_DB_BACKUP_RECOVERY"=dword:value
```

## File

auto\_dbbackup\_on.conf (used to enable the backup and recovery functions for the monitoring object database)

auto\_dbbackup\_off.conf (used to disable the backup and recovery functions for the monitoring object database)

## Storage directory

In Windows

For a physical host:

*Scope-path*\conf\

For a logical host:

*shared-folder*\jp1scope\conf\

In UNIX

For a physical host:

/etc/opt/jp1scope/conf/

For a logical host:

*shared-directory*/jp1scope/conf/

## Description

This file defines whether to enable the function that protects the monitoring object database from corruption that may be caused by OS shutdown or cluster system switching during monitoring tree update processing (automatic backup and recovery functions for the monitoring object database).

If enabled, this function backs up the existing monitoring object database when the monitoring tree is updated, and performs recovery from the backup of the monitoring object database in the event of a failure (if update processing finishes without a failure occurring, the backup data is automatically deleted).

When JP1/IM - Manager is newly installed, this function is enabled by default, but when JP1/IM - Manager is upgraded, the legacy settings are inherited.

When you are operating in a cluster operation system, you must enable this function.

## When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the `jbssetcnf` command.

## Information that is specified

[*logical-host-name*\JP1SCOPE\BMS]

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify JP1\_DEFAULT for the physical host and *logical-host-name* for a logical host.

"AUTO\_DB\_BACKUP\_RECOVERY"=dword:*value*

- The value of `auto_dbbackup_on.conf` is 00000001.
- The value of `auto_dbbackup_off.conf` is 00000000.

Do not edit this parameter.

## Coding example

This example enables the automatic backup and recovery functions for the monitoring object database of JP1/IM - Manager on the HostA logical host:

```
[HostA\JP1SCOPE\BMS\JCSDB] "AUTO_DB_BACKUP_RECOVERY"=dword:00000001
```

## ◆ Definition file for on memory mode of status change condition

### Format

```
[logical-host-name\JP1SCOPE\BMS]  
"EVENT_MATCH_MODE"=dword:value
```

### File

Use any file.

### Storage directory

In Windows

Any folder

In UNIX

Any directory

### Description

This definition file is used to enable the memory-resident status change condition function.

In JP1/IM - Manager that has been installed as a new installation, this function is enabled. In JP1/IM - Manager that has been installed as an upgrade installation, the same setting that was specified in the previous version is initially retained.

### When the definitions are applied

The definition takes effect after JP1/IM - Manager is restarted by executing the `jbssetcnf` command.

### Information that is specified

```
[logical-host-name\JP1SCOPE\BMS]
```

Specifies the key name for the JP1/IM environment settings.

For *logical-host-name*, specify `JP1_DEFAULT` for the physical host and *logical-host-name* for a logical host.

```
"EVENT_MATCH_MODE"=dword:value
```

To enable the memory-resident status change condition function, specify 1; to disable the function, specify 0.

## ◆ System profile of Central Scope (jcs\_sysprofile\_xxx.def)

### Format

```
DESC_VERSION=1#1  
[SystemProfile]  
  FrameVisible={true | false}  
  Movable={true | false}  
[DisplayColor]  
  :  
[ColorItem]#2  
  Status=monitoring-node-status-identifier  
  Name=monitoring-node-status-name
```

```

[Label]
  R=value
  G=value
  B=value
  A=value
[END]
[TEXT]
  R=value
  G=value
  B=value
[End]
[End]
:
[End]
[DisplayLamp]
  Status=monitoring-node-status-identifier
[End]
[End]

```

#1: Do not change DESC\_VERSION=1.

#2: Do not change the values of Status and Name between [ColorItem] and [End].

## File

For the system profile of Central Scope (jcs\_sysprofile\_xxx.def), the file to edit varies depending on the language in which JP1/IM runs. The following table explains the relation between the language code where JP1/IM runs and the system profile of Central Scope to edit.

Table 2–82: Language codes where JP1/IM runs and the system profile of Central Scope

| OS                | Language type | Language encoding supported by JP1/IM | Definition file                                                                      |
|-------------------|---------------|---------------------------------------|--------------------------------------------------------------------------------------|
| Windows           | Japanese      |                                       | jcs_sysprofile_sjis.def (System profile (Central Scope))                             |
|                   |               |                                       | jcs_sysprofile_sjis.def.model (Model file for the system profile (Central Scope))    |
|                   | English       |                                       | jcs_sysprofile.def (System profile (Central Scope))                                  |
|                   |               |                                       | jcs_sysprofile.def.model (Model file for the system profile (Central Scope))         |
|                   | Chinese       |                                       | jcs_sysprofile_GB18030.def (System profile (Central Scope))                          |
|                   |               |                                       | jcs_sysprofile_GB18030.def.model (Model file for the system profile (Central Scope)) |

|    |               |                                       | jcs_sysprofile_GB18030.def.model (Model file for the system profile (Central Scope)) |

#

Only files of languages supported by the OS are included.

Use the system profile of Central Scope corresponding to the language code (`jcs_sysprofile_xxx.def`).

## Storage directory

In Windows

For a physical host:

*Scope-path*\conf

For a logical host:

*shared-folder*\jplscope\conf

In UNIX

For a physical host:

*/etc/opt/jplscope/conf*

For a logical host:

*shared-directory/jplscope/conf*

## Description

Common definition information for the Central Scope viewer. The contents of this definition file are applied to the following windows:

- Monitoring Tree window
- Visual Monitoring window

## When the definitions are applied

When you log in to Central Console, the definition takes effect. However, if you log in to Central Scope from the Event Console window, you must restart the Event Console window after editing the definition file, and then log in to Central Scope.

## Information that is specified

DESC\_VERSION=1

Indicates the system profile format version.

Do not change this value. If you do so, Central Scope Viewer might not operate correctly.

[SystemProfile] to [End]

Indicates the definition start tag and definition end tag for the system profile.

FrameVisible={true | false}

Specifies whether to display the monitoring node name and the space around an icon. You can specify either `true` or `false`. The value is not case sensitive. Write this parameter between `SystemProfile` and `End`.

If you specify `true`, the monitoring node name and the space around an icon are displayed. If you specify `false`, they are not displayed.

If you omit this parameter, or specify a value other than `true` or `false`, `true` is assumed.

If you upgrade JP1/IM - Manager from version 10-10 or earlier, this parameter is not set for the system profile of the logical host. To specify this parameter, add the description.

Movable={true | false}

Specifies whether to allow drag and drop operations for the monitoring node icon in the map display of the Monitoring Tree window, and the Visual Monitoring window. You can specify either `true` or `false`. The value is not case sensitive. Write this parameter between `SystemProfile` and `End`.

If you specify `true`, you can move the monitoring node icon. If you specify `false`, you cannot move it.

If you omit this parameter, or specify a value other than `true` or `false`, `true` is assumed.

If you upgrade JP1/IM - Manager from version 10-10 or earlier, this parameter is not set for the system profile of the logical host. To specify this parameter, add the description.

[DisplayColor] to [End]

Write a definition block to define the monitoring node status between `DisplayColor` and `End`. Write only one definition block between `SystemProfile` and `End`.

[ColorItem] to [End]

Write the status identifier, status name, and parameter to define the status color, and definition block between `[ColorItem]` and `[End]`. Write this definition block between `[DisplayColor]` and `[End]` for each status.

Status=*monitoring-node-status-identifier*

Specify the status identifier. Write this parameter between `[ColorItem]` and `[End]`. Do not change this value. If you do so, Central Scope Viewer might not operate correctly.

Name=*monitoring-node-status-name*

Specify the status name. Write this parameter between `[ColorItem]` and `[End]`. Do not change this value. If you do so, Central Scope Viewer might not operate correctly.

[Label] to [End]

Write parameters to specify the monitoring node status color, and whether to make the monitoring node color transparent between `[Label]` and `[End]`. When the monitoring node status changes, the color changes to the one corresponding to the new status specified between `[Label]` and `[End]`. Write this definition block only once between `[ColorItem]` and `[End]`.

R=*value*, G=*value*, B=*value*

Specifies the status color of the monitoring node by using the RGB value. Write this parameter between `[Label]` and `[End]`. You can specify an integer from 0 to 255.

If you omit this parameter, specify an integer less than 0, or specify a value other than an integer, 0 is assumed. If you specify a value greater than 255, 255 is assumed.

A=*value*

Specify whether to make the monitoring node status color transparent. Write this parameter between `[Label]` and `[End]`. If the `FrameVisible` parameter is not specified, and `true` is specified for the `FrameVisible` parameter, the status color cannot be transparent regardless the value specified for A. You can specify an integer

from 0 to 255. The smaller the value you specify, the higher the transparent ratio is. If you specify 0, the status color is completely transparent. If you specify 255, the status color is not transparent.

If you omit this parameter, or specify a value that cannot be specified, 255 is assumed.

[TEXT] to [End]

Write parameters to specify the text color of the monitoring node name between [TEXT] and [End]. When the monitoring node status changes, the monitoring node name text color changes to the one corresponding to the new status specified between [TEXT] and [End]. Write this definition block only once between [ColorItem] and [End].

R=value, G=value, B=value

Specifies the monitoring node name text color by using the RGB values. Write these parameters between [TEXT] and [End]. You can specify an integer from 0 to 255.

If you omit this parameter, specify a value less than 0, or specify a non-integer value, 0 is assumed. If you specify a value greater than 255, 255 is assumed. In the initial status after installation, 0 is specified for all of R, G, and B values.

[DisplayLamp] to [End]

Specify parameters used to specify the status when an alarm lamp turns on. When the highest monitoring node status changes, if the status identifier specified for the new status is greater than the value specified between [DisplayLamp] and [End], the applicable alarm lamp turns on. You must write this definition block between [SystemProfile] and [End].

Status=*monitoring-node-status-identifier*

Specify the status when an alarm lamp turns on. Write this parameter between [DisplayLamp] and [End]. You can specify a decimal integer from -2,147,483,648 to 2,147,483,647.

If you omit this parameter, or specify a value that cannot be specified, 0 is assumed. If the status indicator specified for the highest monitoring node status is greater than the value specified for this parameter, an alarm lamp turns on. The following table explains the correspondences between the values specified for this parameter and the statuses when the alarm lamp turns on.

**Table 2–83: Correspondence between the specified values and the statuses when the alarm lamp turns on**

| Specified value       | Status when the alarm lamp turns on                                    |
|-----------------------|------------------------------------------------------------------------|
| -2,147,483,648 to 100 | Initial, debug, normal, warning, error, critical, alert, and emergency |
| 101 to 200            | Debug, normal, warning, error, critical, alert, and emergency          |
| 201 to 300            | Normal, warning, error, critical, alert, and emergency                 |
| 301 to 400            | Warning, error, critical, alert, and emergency                         |
| 401 to 500            | Error, critical, alert, and emergency                                  |
| 501 to 600            | Critical, alert, and emergency                                         |
| 601 to 700            | Alert, and emergency                                                   |
| 701 to 800            | Emergency                                                              |
| 801 to 2,147,483,648  | Does not turn on                                                       |

We recommend you specify 200, 300, 400, 500, 600, 700, or 800.

## Notes

- The setting item name is case sensitive.

- Specify a value for each item immediately after the equal sign (=). If you add a space or a tag, the value cannot be recognized.
- If the start tag is unintentionally deleted, the file format invalid message (KAVB7303-E) is output, and the operation of JP1/IM - View stops. Also, if the tag is unintentionally changed, the definition is not recognized.
- If the end tag is unintentionally changed or deleted, the file format invalid message (KAVB7303-E) is output, and the operation of JP1/IM - View stops.
- If you edit the system profile of Central Scope (`jcs_sysprofile_xxx.def`), the changes are not applied to the Monitoring Tree (Editing) and Visual Monitoring (Editing) windows. If you want to change settings of these windows, edit the system profile of the Central Scope viewer (`system.conf`).

## 2.7 JP1/IM - Manager definition files (IM Configuration Management)

### ◆ Apply-IM-configuration-method definition file (jp1cf\_applyconfig.conf)

#### Format

```
[logical-host-name\JP1CONFIG]
"APPLY_CONFIG_TYPE"=dword:{00000000 | 00000001}
```

#### File

jp1cf\_applyconfig.conf (file that sets the application method of IM configuration)

#### Storage directory

In Windows

For a physical host:

*Manager-path*\conf\imcf\

For a logical host:

*shared-folder*\JP1IMM\conf\imcf\

In UNIX

For a physical host:

Physical host: /etc/opt/jp1imm/conf/imcf/

For a logical host:

Logical host: *shared-directory*/jp1imm/conf/imcf/

#### Description

This file defines how to apply the system hierarchy.

The methods for applying the agent configurations include the differential distribution method, the batch distribution method (with the deletion of configuration information), and the batch distribution method (without the deletion of configuration information).

When the condition below is met, you can use the apply-IM-configuration-method definition file to switch between the batch distribution method (with the deletion of configuration information) and the batch distribution method (without the deletion of configuration information):

- The differential distribution functionality is disabled in the JP1/Base settings for distributing configuration definition information, and the function for restricting the viewing of and operations on business groups is disabled.

For details about how to apply the system hierarchy, see 8.2.6 *Applying the system hierarchy* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### When the definitions are applied

After the `jbssetcnf` command is executed to apply the definitions to the JP1 common definition information, the settings are applied when JP1/IM - Manager is started or restarted, or when the file is reloaded by using the `jco_spmc_reload` command.

## Information that is specified

[*logical-host-name*\JP1CONFIG]

Indicates the key name of the application method of IM configuration.

For the physical host, specify JP1\_DEFAULT for *logical-host-name*. For a logical host, specify its name for *logical-host-name*.

"APPLY\_CONFIG\_TYPE"=dword:{00000000 | 00000001}

Specify the method for applying the system hierarchy.

- 00000000  
Specify this value to use the batch distribution method (with the deletion of configuration information) to apply the system hierarchy. Applies the system hierarchy configuration after deletion. This item is set by default.
- 00000001  
Specify this value to use the batch distribution method (without the deletion of configuration information) apply the system hierarchy. Applies the system hierarchy configuration without deleting it.

If the value is invalid or if the common definition has not been set, the default value is assumed.

## Example definition

```
[JP1_DEFAULT\JP1CONFIG]
"APPLY_CONFIG_TYPE"=dword:00000001
```

## ◆ Host input information file (host\_input\_data.csv)

### Format

```
product-name;file-format-version;character-encoding
Host_name,IPAddress,Host_list,Comment,Host_type,Running_host_name,Standby_host_name,VMM_host_name,Virtual_manager_type,Username>Password,Domain_name,Connection_type,Virtual_host_manager,Remote_connection_type,Authentication_section,Port_number,SSH_private_key_path
host-name,IP-address,list-of-host-names,comment,host-type,executing-host,standby-host,VMM-host,virtualization-management-type,user-name,password,domain-name,communication-type,virtualization-management-former-host-name,remote-communication-type,authentication-information-section,port-number,private-key-path
```

### File

host\_input\_data.csv (host input information file)

### Storage directory

In Windows

Any folder

In UNIX

Any directory

## Description

This file is the export file for host input information related to hosts managed by IM Configuration Management. You can edit and import this file.

## When the definitions are applied

The definitions are applied when the file is imported by using the `jcfimport` command.

## Information that is specified

The following table describes the host information to be output to the host input information file.

Table 2–84: Host information to be exported (host input information file)

| Line                        | Output item                                | Output value                                                                                                                                                                |
|-----------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line 1 (header information) | Product name                               | JP1/IM-CF                                                                                                                                                                   |
|                             | File format version                        | File format version.<br>For example, if the JP1/IM - Manager version is 10-50, 101000 is output.                                                                            |
|                             | Character encoding                         | Character encoding.<br>The value depends on the LANG environment variable setting of the manager. For details, see <a href="#">Table 2-85 Character encoding of files</a> . |
| Line 2 (header information) | Host name                                  | Host_name                                                                                                                                                                   |
|                             | IP address                                 | IPAddress                                                                                                                                                                   |
|                             | List of host names                         | Host_list                                                                                                                                                                   |
|                             | Comment                                    | Comment                                                                                                                                                                     |
|                             | Host type                                  | Host_type                                                                                                                                                                   |
|                             | Executing host                             | Running_host_name                                                                                                                                                           |
|                             | Standby host                               | Standby_host_name                                                                                                                                                           |
|                             | VMM host                                   | VMM_host_name                                                                                                                                                               |
|                             | Virtualization management type             | Virtual_manager_type                                                                                                                                                        |
|                             | User name                                  | Username                                                                                                                                                                    |
|                             | Password                                   | Password                                                                                                                                                                    |
|                             | Domain name                                | Domain_name                                                                                                                                                                 |
|                             | Communication type                         | Connection_type                                                                                                                                                             |
|                             | Virtualization management former host name | Virtual_host_manager                                                                                                                                                        |

|                             | Authentication information section         | Authentication_section                                                                                                                                                      |
|                             | Port number                                | Port_number                                                                                                                                                                 |
|                             | Private key path                           | SSH_private_key_path                                                                                                                                                        |
| Line 3 and subsequent lines | Host name                                  | Name of a host registered in the system hierarchy configuration                                                                                                             |

| Line | Output item                                | Output value                                                                                                                                                                                                |
|------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | IP address                                 | IP address of a host registered in the system hierarchy configuration (When there are multiple IP addresses, separate them by a comma ( , ), and enclose all IP addresses in double-quotation marks ( " )). |
|      | List of host names                         | List of host names registered on a host (When there are multiple lists, separate them by a comma ( , ), and enclose all lists in double-quotation marks ( " )).                                             |
|      | Comment                                    | Comment registered on a host                                                                                                                                                                                |
|      | Host type                                  | Type of host (physical, logical, virtual, unknown)                                                                                                                                                          |
|      | Executing host                             | Name of the host used as the executing host                                                                                                                                                                 |
|      | Standby host                               | Name of the host used the standby host (When there are multiple standby host names, separate them by a comma ( , ), and enclose all standby host names in double-quotation marks ( " )).                    |
|      | VMM host                                   | Name of the host on which the virtual machine monitor is running                                                                                                                                            |
|      | Virtualization management type             | Type of virtualization management (vCenter, JP1/SC/CM, SCVMM, HCSM, ESX <sup>#1</sup> , Hyper-V, KVM, Virtage <sup>#2</sup> )                                                                               |
|      | User name                                  | User name                                                                                                                                                                                                   |
|      | Password                                   | Password information is not output.                                                                                                                                                                         |
|      | Domain name                                | Domain name of the host on which the virtual machine monitor is running.                                                                                                                                    |
|      | Communication type                         | Communication type (http, https, ssh)                                                                                                                                                                       |
|      | Virtualization management former host name | Host name registered on a host                                                                                                                                                                              |
|      | Remote communication type                  | Communication type to be output for remote monitoring (disable, ssh, wmi)                                                                                                                                   |
|      | Authentication information section         | Authentication information to be output for remote monitoring (common, host, blank)                                                                                                                         |
|      | Port number                                | Number of the port used for communication                                                                                                                                                                   |
|      | Private key path                           | Absolute path of the private key file to be used for SSH connection                                                                                                                                         |

#1: ESX indicates VMware ESX.

#2: Virtage indicates the Hitachi Compute Blade logical partitioning feature.

**Table 2–85: Character encoding of files**

| OS      | Format of the LANG environment variable | Character encoding to be converted |
|---------|-----------------------------------------|------------------------------------|
| Windows | --                                      | Japanese OS: MS932                 |
|         |                                         | English OS: C (ISO-8859-1)         |
|         |                                         | Chinese OS: GB18030                |
| Linux   | ja_JP.UTF-8 or ja_JP.utf8               | Japanese OS: UTF-8                 |
|         | ja_JP.sjis or ja_JP.SJIS <sup>#</sup>   | Japanese OS: Shift_JIS             |
|         | C                                       | English OS: C (ISO-8859-1)         |
|         | zh_CN.gb18030                           | Chinese OS: GB18030                |
| --      | Other than above                        | UTF-8                              |

Legend:  
--: Not applicable  
#: Valid only when the OS is SUSE Linux.

File

host\_collect\_data.csv (collected host information file)

Storage directory

- In Windows
  - Any folder
- In UNIX
  - Any directory

Description

This file is the export file for collected host information related to managed hosts of IM Configuration Management. This file cannot be edited or imported.

Information that is specified

The following table describes the host information to be output to the collected host information file.

Table 2–86: Host information to be exported (Collected host information file)

| Line                            | Output item                                      | Output value                                                                                                                                                                |
|---------------------------------|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line 1 (header information)     | Product name                                     | JP1/IM-CF                                                                                                                                                                   |

|                                 | Installation path                                | Installation path of a product                                                                                                                                              |
|                                 | Storage folder for the environment settings file | Folder in which the environment setting file of a product is stored                                                                                                         |
|                                 | Update date/time                                 | YYYY/MM/DD hh:mm:ss                                                                                                                                                         |
|                                 | Update date/time (GMT)                           | YYYY/MM/DD hh:mm:ss (GMT) <sup>#1</sup>                                                                                                                                     |
|                                 | Host name                                        | Name of a host registered in the system hierarchy configuration                                                                                                             |
|                                 | Virtualization management type                   | Type of virtualization management (vCenter, JP1/SC/CM, SCVMM, HCSM, ESX <sup>#2</sup> , Hyper-V, KVM, Virtage <sup>#3</sup> )                                               |
|                                 | Virtualization product version <sup>#4</sup>     | Version of a virtualization product.<br>Virtualization configuration collection date/time is output as the update date/time.                                                |

<sup>#1</sup>: When virtualization software and virtualization environment management software are used, the virtualization configuration collection date/time is output.

<sup>#2</sup>: ESX indicates VMware ESX.

#3: Virtage indicates the Hitachi Compute Blade logical partitioning feature.

#4: If the virtualization management type is HCSM, the version of an external connection interface for HCSM is displayed. For this reason, the displayed version and the actual version for HCSM might be different. Furthermore, if you obtain virtualization configuration information from HCSM, the version number is not displayed for a host whose virtualization management type is Hitachi Compute Blade logical partitioning feature.

## Output example

## ◆ Profile management environment definition file (jp1cf\_profile\_manager.conf)

### Format

```
[logical-host-name\JP1CONFIG\PROFILE_MANAGER\JP1BASE]
"LOGFILETRAP_AUTO_START_CONTROL"=dword:hexadecimal-number
"AGENT_PROFILE_UPDATE_NOTICE"=dword:hexadecimal-number
```

### File

jp1cf\_profile\_manager.conf (profile management environment definition file)

jp1cf\_profile\_manager.conf.model (model file for the profile management environment definition file)

### Storage directory

In Windows

*Manager-path*\conf\imcf

In UNIX

/etc/opt/jplimm/conf/imcf

### Description

This file defines information about the execution environment for the profile management function.

### When the definitions are applied

The definition takes effect when JP1/IM - Manager is restarted after the `jbssetcnf` command is executed in JP1/Base to apply the definition in the profile management environment definition file to the JP1 common definition information.

## Information that is specified

[*logical-host-name*\JP1CONFIG\PROFILE\_MANAGER\JP1BASE]

Specify the key name of the profile management environment definition.

For *logical-host-name*, specify JP1\_DEFAULT for a physical host and *logical-host-name* for a logical host.

"LOGFILETRAP\_AUTO\_START\_CONTROL"=dword:*hexadecimal-number*

Specify whether to enable the use of the function for setting the automatic startup of log file traps in the Display/Edit Profiles window of JP1/IM - View. If this function is enabled, the **Start the process automatically when the log file trap service starts** check box is displayed in **Startup options**.

- 00000001: Enable
- 00000000: Disable

The default is 00000001 (enable).

"AGENT\_PROFILE\_UPDATE\_NOTICE"=dword:*hexadecimal-number*

Specify whether to enable the use of the function that sends notifications indicating that agent profiles might have been updated when profiles are edited or applied in the Display/Edit Profiles window of JP1/IM - View.

- 00000001: Enable
- 00000000: Disable

The default is 00000001 (enable).

## ◆ Remote log trap environment definition file (jp1cf\_remote\_logtrap.conf)

### Format

```
[logical-host-name\JP1CONFIG\AGTLESS_MGR]
"MAX_COLLECT_EVENTLOG_DATA_SIZE"=dword:hexadecimal-number
"MAX_COLLECT_WIN_LOG_DATA_SIZE"=dword:hexadecimal-number
"MAX_COLLECT_UNIX_LOG_DATA_SIZE"=dword:hexadecimal-number
"START_OPTION"="warm" | "cold"
```

### File

jp1cf\_remote\_logtrap.conf (remote log trap environment definition file)

jp1cf\_remote\_logtrap.conf.model (model file for the remote log trap environment definition file)

### Storage directory

In Windows

*Manager-path*\conf\imcf

In UNIX

/etc/opt/jplimm/conf/imcf

### Description

This file defines an execution environment for the remote-monitoring log file trap function and the remote-monitoring event log trap function.

## When the definitions are applied

In the common definition settings file, specify the remote log trap environment definition file as the argument for the `jbssetcnf` command. After that, the remote log trap environment definition file settings take effect when either of the following triggers occurs:

- When JP1/IM - Manager restarts
- When you perform a reload by executing the `jco_spmd_reload` command

Note that when this definition is applied, the total capacity of the logs that can be monitored by a single instance of JP1/IM - Manager is checked. If the capacity exceeds 10 MB, a KNAN26143-W warning message is output to the integrated trace log.

## Information that is specified

[*logical-host-name*\JP1CONFIG\AGTLESS\_MGR]

Specify the key name of the remote log trap environment definition.

For *logical-host-name*, specify JP1\_DEFAULT for a physical host and *logical-host-name* for a logical host.

"MAX\_COLLECT\_EVENTLOG\_DATA\_SIZE"=dword:*hexadecimal-number*

Specifies in hexadecimal notation the maximum size of the event log that can be collected in one monitoring interval of the remote monitoring event log trap. You can specify any value in the range from 0x00002800 to 0x00032000 (10 KB to 200 KB). If this information is omitted, 0x00002800 (10 KB) is assumed.

"MAX\_COLLECT\_WIN\_LOG\_DATA\_SIZE"=dword:*hexadecimal-number*

Specifies in hexadecimal notation the maximum size of the log that can be collected in one monitoring interval of the remote monitoring log file trap when the monitored host is Windows. You can specify any value in the range from 0x00002800 to 0x00032000 (10 KB to 200 KB). If this information is omitted, 0x00002800 (10 KB) is assumed.

"MAX\_COLLECT\_UNIX\_LOG\_DATA\_SIZE"=dword:*hexadecimal-number*

Specifies in hexadecimal notation the maximum size of the log that can be collected in one monitoring interval of the remote monitoring log file trap when the monitored host is UNIX. You can specify any value in the range from 0x00002800 to 0x0000C800 (10 KB to 50 KB). If this information is omitted, 0x00002800 (10 KB) is assumed.

"START\_OPTION"="warm" | "cold"

Specify whether logs that are output while remote monitoring is stopped are to be collected when remote monitoring resumes.

If "warm" is specified, logs that are output while remote monitoring is stopped will be collected.

If "cold" is specified, logs that are output while remote monitoring is stopped will not be collected.

If this information is omitted, "warm" is assumed.

## Example definition

Example 1 (in Windows)

```
[JP1_DEFAULT\JP1CONFIG\AGTLESS_MGR]
"MAX_COLLECT_EVENTLOG_DATA_SIZE"=dword:00002800
"MAX_COLLECT_WIN_LOG_DATA_SIZE"=dword:00002800
"MAX_COLLECT_UNIX_LOG_DATA_SIZE"=dword:00002800
"START_OPTION"="warm"
```

## Example 2 (In UNIX)

```
[JP1_DEFAULT\JP1CONFIG\AGTLESS_MGR]
"MAX_COLLECT_UNIX_LOG_DATA_SIZE"=dword:00002800
"START_OPTION"="warm"
```

If the manager host is a UNIX host and the managed host is a Windows host, remote monitoring cannot be performed. In such cases, if MAX\_COLLECT\_EVENTLOG\_DATA\_SIZE or MAX\_COLLECT\_WIN\_LOG\_DATA\_SIZE is specified, it will be ignored.

## ◆ Remote-monitoring log file-trap action definition file

### Format

```
retry-times=number-of-retries
retry-interval=retry-interval
open-retry-times=number-of-retries
open-retry-interval=retry-interval
hold-count=number-of-held-JP1-events
keep-event={ OLD | NEW }
unset-extattr=attribute-suppressing-output
FILETYPE={ SEQ | SEQ2 | WRAP2 }
HEADLINE=number-of-header-lines
MARKSTR=[!] "regular-expression"
[!] "regular-expression-n"#
ACTDEF=[{EXIT}] [event-level] [event-ID] [!] "regular-expression"
[!] "regular-expression-n"#
```

#: "*regular-expression-n*" indicates that multiple regular expressions are specified.

### File

Use any file.

### Storage directory

In Windows

Any folder

In UNIX

Any directory

### Description

This file defines the actions for the remote monitoring log file trapping function. Its contents are referenced when the remote monitoring log file trapping function is started.

If you use UTF-8 as the encoding to save a file, save the file without attaching a BOM (byte order mark).

### When the definitions are applied

The settings for the remote-monitoring log file-trap action definition file take effect at the following times:

- When a reload or restart operation is performed from the Display/Edit Profiles window  
For details about the Display/Edit Profiles window, see *5.9 Display/Edit Profiles window* in the *JP1/Integrated Management 3 - Manager GUI Reference*.
- When the `jcfallogstart` or `jcfallogreload` command is executed  
For details about the `jcfallogstart` command, see *jcfallogstart* in *Chapter 1. Commands*. For details about the `jcfallogreload` command, see *jcfallogreload* in *Chapter 1. Commands*.
- When JP1/IM - Manager is restarted

## Information that is specified

### `retry-times`

Specify a value from 0 to 86,400 for the number of retries to be attempted when a connection to an event service cannot be established due to a temporary communication failure. If this parameter is omitted, no retry operation is performed.

### `retry-interval`

Specify a value from 1 to 600 (seconds) for the interval between retries to be performed when a connection to an event service cannot be established due to a communication failure. If this parameter is omitted, 10 seconds is assumed. This setting takes effect when the number of retries for connecting to an event service is set to one or a greater value. The retry interval is the interval between a failed attempt to connect to an event service and the next attempt. The time required for connection to an event service is not included. By combining `retry-times` and `retry-interval`, you can set a time equal to or longer than 24 hours, but if you do so and 24 hours or more passes after a retry attempt starts, retry processing stops.

### `open-retry-times`

Specify a value from 1 to 3,600 as the number of retries to be performed if a log file cannot be read, or connection to the monitored host cannot be established. If this parameter is omitted, 1 is assumed. If the specified number of retries is exceeded, monitoring of the log file is stopped.

### `open-retry-interval`

Specify a value from 3 to 600 (seconds) as the interval for retries to be performed if a log file cannot be read, or connection to the monitored host cannot be established. If this value is omitted, 3 (seconds) is assumed. The retry interval is the interval between the occurrence of an error and the next retry attempt.

### `hold-count`

Specify a value from 1 to 100 as the number of JP1 events that can be held during retry processing. If this parameter is omitted, 100 is assumed. Executing a retry requires resources for holding JP1 events converted during retry processing. The amount of memory necessary for retry processing is as follows:

- $\text{number-of-held-JP1-events} \times 1 \text{ KB}$

### `keep-event={ OLD | NEW }`

When the number of JP1 events held during retry processing exceeds the limit, the excess JP1 events are removed. Use either of the values below to specify the type of events (old JP1 events or new JP1 events) to be kept when the number of held JP1 events exceeds the limit. If this parameter is omitted, `OLD` is assumed.

#### `OLD`

Specify this value if you want to keep old JP1 events. If this value is specified, values not exceeding the number of JP1 events specified in `hold-count` are held, and any JP1 events generated thereafter are removed.

#### `NEW`

Specify this value if you want to keep new JP1 events. If this value is specified and the set number of held JP1 events is exceeded, the JP1 events are removed starting from the oldest events.

## unset-extattr

Specify this value when you do not want to output an attribute. You can set this value when the version of JP1/Base is 10-50 or later. If you do not want to output the monitoring name, specify TRAP\_NAME. If you do not want to output the monitoring ID, specify TRAP\_ID. If you do not want to output either of them, specify TRAP\_NAME and TRAP\_ID by separating them with a comma (, ). The following is a specification example of when the monitoring name and monitoring ID are not output:

Example:

```
TRAP_NAME, TRAP_ID
```

This parameter must be written in a line.

FILETYPE={ SEQ | SEQ2 | WRAP2 }

Specify the data output format of the log file to trap. If this parameter is omitted, SEQ is assumed.

For details about the data output format of the log file to trap, see 8.6.3(1) *Output formats of log file trap information* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

## HEADLINE

Specify a value from 0 to 99,999 as the number of header lines when there is a header at the beginning of the log file to be read. If this parameter is omitted, it is assumed that there is no header.

Note that if the size of a character string in the specified header exceeds the upper limit for header size (10 kilobytes), an error occurs.

MARKSTR=[ ! ] "regular-expression"

Specifies, using regular expressions, data that you do not want to monitor, such as data that is not log data. If this parameter is omitted, it is assumed that no data is excluded as data to be monitored. Enclose a regular expression in double-quotation marks ("). Data that is not log data refers to data that is output to a log file at a certain interval. The following are examples.

Example:

```
"==== 13:00:00 JP1/Base Event ====="
```

If an exclamation mark (!) is inserted before a double-quotation mark ("), the regular expression becomes an exclusion-condition and any data not matching the specified regular expression is not monitored.

You can specify multiple regular expressions for a single MARKSTR parameter. If multiple regular expressions are specified, the AND condition is applied. Therefore, the only data that is not subject to monitoring is the data that matches all the regular expression conditions, including the specification of the exclamation mark (!). Separate multiple regular expressions by a linefeed. On line 2 and subsequent lines, specify only values, and type at least one space before a value on each of the lines. The following example shows how to specify data that contains ==== and MARK as data that is not to be monitored:

Example:

```
MARKSTR="====" (linefeed)
```

```
Δ Δ Δ Δ Δ "MARK"
```

Legend: Δ indicates a single-byte space.

This parameter can be specified multiple times. You can specify this parameter as many times as you wish. When multiple parameters are specified, the OR condition is applied, and any data that matches any specification is not monitored.

A regular expression specified for this parameter is checked from the beginning of the entered log data to the length specified by the -m option of the jevlogstart command. If this parameter is omitted, it is assumed that all data is log data.

ACTDEF=[ {EXIT} ] [*event-level*] [*event-ID*] [!] "*regular-expression*"

Specifies a regular expression for the log data to be converted to JP1 events, event IDs corresponding to those JP1 events, and event levels. If this parameter is omitted, it is assumed that none of the above values are specified. If there is log data that matches the regular expression, a JP1 event is issued with the specified event ID. Do not use a space or a tab before or after =, EXIT, *event-level*, or *event-ID*. If you do so, a syntax error occurs.

EXIT

If multiple ACTDEF parameters are specified and log data matches a condition specified for EXIT, monitoring of the log data ends.

If multiple ACTDEF parameters are specified and one log data item matches multiple ACTDEF parameter conditions, JP1 events equal to the number of matched conditions are issued. If EXIT is specified, a JP1 event is issued with the event ID of the condition specified for EXIT, after which no more log data is monitored.

*event-level*

Specify the event level for the extended attribute of a JP1 event by enclosing it in left and right angle brackets (< and >). You can specify the following values:

Emergency

Alert

Critical

Error

Warning

Notice

Information

Debug

If this parameter is omitted, Notice is assumed.

*event-ID*

Specify an event ID for registering a JP1 event on an event server. Separate the first four bytes (basic code) and the last four bytes (extended code) of the event ID by a colon (:), and write the ID in hexadecimal notation. Use uppercase A to F. Note that the last four bytes (the four bytes after the colon) can be omitted, in which case 0 is assumed for the omitted value. Zeros (0) are also inserted for any non-specified digits, beginning on the left side, if either the first or last four bytes have fewer than eight digits. Use a user-specifiable value from 0:0 to 1FFF:0 and 7FFF8000:0 to 7FFFFFFF:0. For an extended code, specify 0. Event ID format examples are provided below.

Example:

The following three specifications have the same meaning:

0000011A:00000000

11A:0

11A

"*regular-expression*"

Specify the log data to be converted to a JP1 event in a regular expression. The regular expression you can use is fixed to the extended normal expression. Enclose a regular expression in double-quotation marks ("). If an exclamation mark (!) is inserted before the first double-quotation mark ("), the regular expression becomes an exclusion-condition and any data that does not match the specified regular expression is converted.

You can specify multiple regular expressions for a single ACTDEF parameter. If multiple regular expressions are specified, the AND condition is applied. Therefore, only data that matches all the regular expression conditions, including specification of the exclamation mark (!), is converted to JP1 events. Separate multiple regular expressions by a linefeed. On line 2 and subsequent lines, specify only values, and type at least one space before a

value on each of the lines. The following example shows how to specify data that contains `jp1base` and `error` as data to be converted to the JP1 event with event ID 00000333:

Example:

```
ACTDEF=00000333 "jp1base" (linefeed)
Δ Δ Δ Δ "error"
```

Legend: Δ indicates a single-byte space.

More than one of this parameter can be specified. You can specify this parameter as many times as you wish. When multiple parameters are specified, the OR condition is applied, and any data that matches a specification is converted to JP1 events.

A regular expression specified for this parameter is checked from the beginning of the entered log data to the length specified as the *maximum length of data converted to an event for a startup option (bytes)*.

This parameter cannot be omitted.

## Example definition

Example definition for the MARKSTR and ACTDEF parameters

The following examples show example definitions for the MARKSTR and ACTDEF parameters based on the following log data.

|    |                                                                                                               |             |     |                                                                          |                      |

| 14 | 2016/01/02    15:10:45.501                                                                                    | KAXA 2178-E |     | ***** An error occurs in the communication between HostD and HostA. **** |                      |
| 15 | 2016/01/02    15:10:46.149                                                                                    | KAXA 4072-E |     | A memory shortage occurred in HostB.                                     |                      |
| 16 | 2016/01/02    15:12:48.410                                                                                    | KAXA 4037-W |     | A delay occurs in HostE startup.                                         |                      |

Example definition 1

The log file trap conditions are listed on the left, and the example definition for the log file-trap action definition file is shown on the right.

|   | Conditions                                                                | Example definition                                          |
|---|---------------------------------------------------------------------------|-------------------------------------------------------------|
| 1 | Lines 1, 2 and 9 are not subject to monitoring because they are headers.  | MARKSTR="^\ *\ *\ *"<br>MARKSTR="^ yyyy/mm/dd hh:mm:ss:sss" |
| 2 | An error (-E) message is registered as a JP1 event whose event ID is 112. | ACTDEF= {EXIT} <Error>111"KAXA4072-E"                       |
| 3 | KAXA4072-E is registered as a JP1 event whose event ID is 111.            | ACTDEF=<Error>112"KAXA....-E"                               |

● Matching conditions are applied in the defined order. When a definition is defined so that matching is performed in the order of condition 2 and condition 3, a message that contains KAXA4072-E matches condition 2 and condition 3. As a result, two JP1 events whose event IDs are 111 and 112 are registered. Because of this, define the matching order of condition 3 and condition 2, and then define {EXIT} so that the subsequent monitoring is not performed if condition 3 is matched.

### Example definition 2

Log file trap conditions that are different from the conditions listed for example definition 1 are listed on the left, and the example definition for the log file-trap action definition file is shown on the right.

|   | Conditions                                                                                                                                       | Example definition                                          |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| 1 | Lines 1, 2, 9, and 10 are not subject to monitoring because they are headers.                                                                    | MARKSTR="^\ *\ *\ *"<br>MARKSTR="^ yyyy/mm/dd hh:mm:ss:sss" |
| 2 | All of the messages that contain HostA are not subject to monitoring. If the messages also contain HostD, however, they are monitored.           | MARKSTR="HostA"<br>!"HostD"                                 |
| 3 | An error (-E) message is registered as a JP1 event whose event ID is 112.                                                                        | ACTDEF= {EXIT} <Notice>111"HostD"                           |
| 4 | An error (-E) message that contains HostC and KAXA4072-E is registered as a JP1 event whose event ID is 999 and severity is Information.         | ACTDEF= {EXIT} <Information>999"KAXA4072-E"<br>"HostC"      |
| 5 | A warning (-W) message is registered as an event for which event ID is 113. If the message contains HostE, however, conversion is not performed. | ACTDEF=<Error>112"KAXA....-E"                               |
| 6 | A message that contains HostD is registered as a JP1 event whose event ID is 111 and severity is Information.                                    | ACTDEF=<Warning>113"KAXA....-W"<br>!"HostE"                 |

● Matching conditions are applied in the defined order. When a definition is defined so that matching is performed in the order of condition 3 and condition 4, two JP1 events whose event IDs are 112 and 999 are registered for a message that contains KAXA4072-E and HostC. Because of this, define the matching order of condition 4 and condition 3, and then define {EXIT} so that the subsequent monitoring is not performed if condition 4 is matched.

● If {EXIT} is not defined for condition 6, JP1 events whose IDs are 111 and 112 are registered for error messages that contain HostD, and JP1 events whose event IDs are 111 and 113 are registered for warning messages that contain HostD.

## ◆ Remote-monitoring event log trap action-definition file

### Format

```

retry-times number-of-retries
retry-interval retry-interval
open-retry-times number-of-retries-for-event-log-collection
open-retry-interval retry-interval-for-event-log-collection
trap-interval monitoring-interval
matching-level comparison-level
filter-check-level filter-check-level
# filter

```

```
filter log-type [id=event-ID] [trap-name=log-file-trap-name]
    conditional-statement-1
    conditional-statement-2
    :
    conditional-statement-n
end-filter
```

## File

Use any file.

## Storage directory

In Windows

Any folder

In UNIX

Any directory

## Description

This file defines the actions of the event log trapping function for remote monitoring. Its contents of the file are referenced when the remote monitoring event log trapping function is started.

If you use UTF-8 as the encoding to save a file, save the file without attaching a BOM (byte order mark).

## When the definitions are applied

The settings for the remote-monitoring event log trap action-definition file take effect at the following times:

- When a reload or restart operation is executed from the Display/Edit Profiles window  
For details about the Display/Edit Profiles window, see *5.9 Display/Edit Profiles window* in the *JP1/Integrated Management 3 - Manager GUI Reference*.
- When the `jcfaleltstart` or `jcfaleltreload` command is executed  
For details about the `jcfaleltstart` command, see *jcfaleltstart (Windows only)* in *Chapter 1. Commands*. For details about the `jcfaleltreload` command, see *jcfaleltreload (Windows only)* in *Chapter 1. Commands*.
- When JP1/IM - Manager is restarted

## Information that is specified

`retry-times`

Specify a value from 0 to 86,400 for the number of retries to be attempted when a connection to an event service cannot be established due to a temporary communication failure. If this parameter is omitted, no retry operation is performed. If the specified number of retries has been attempted but none have been successful, an error occurs. By combining `retry-times` and `retry-interval`, you can set a time equal to or longer than 24 hours, but if you do so and 24 hours or more passes after a retry attempt starts, retry processing stops.

`retry-interval`

Specify a value from 1 to 600 (seconds) for the interval between retries to be performed when a connection to an event service could not be established due to a temporary communication failure. If this value is omitted, 10 seconds is assumed.

#### `open-retry-times`

Specify a value from 1 to 3,600 as the number of times to retry the event log collection processing when the processing fails or the connection to the monitored host fails. If this value is omitted, a retry count of 3 times is assumed. When the specified number of retries is exceeded, the monitoring of log files stops.

#### `open-retry-interval`

Specify a value from 3 to 600 (seconds) as the interval between retries when the event log collection processing fails or the connection to the monitored host fails. If this value is omitted but a value is specified for `trap-interval`, the value specified for `trap-interval` is assumed. If `trap-interval` is not specified, 300 seconds is assumed. The retry interval is the length of time before a retry is attempted after an error occurs.

#### `trap-interval`

Specify a value from 60 to 86,400 (seconds) as the interval for monitoring event logs. If this value is omitted, 300 (seconds) is assumed. Event log traps monitor event logs at a fixed interval.

#### `matching-level`

Specify the comparison level of an event log and the definition if the explanatory text of an event log cannot be read because the message DLL or the category DLL is not set correctly when the `message` or `category` attribute is specified for a filter. If 0 is specified, the items are not compared, but are compared with the next filter. If 1 is specified, the items are compared. If this parameter is omitted, 0 is assumed.

#### `filter-check-level`

Specify the check level when an invalid log type (a type non-existent in the system) or an invalid regular expression is specified for a filter. If 0 is specified and a filter contains an invalid log type or regular expression, the applicable filter is disabled. If at least one valid filter exists, the remote-monitoring event log trap is started or loaded successfully. If there is no valid filter, the remote-monitoring event log trap fails to start or reload. If 1 is specified and the filter has at least one invalid log type or regular expression, the remote-monitoring event log trap fails to start or reload. If this parameter is omitted, 0 is assumed.

#### `filter to end-filter`

##### *log-type*

Specify the type of event log to be monitored.

Example:

Application

Security

System

DNS Server

Directory Service

File Replication Service

DFS Replication

When the same log type is specified for multiple filters, the condition is satisfied if the conditions for any one of the filters are met.

##### `[id=event-ID]`

Specify an event ID for registering a JP1 event on an event server. Write the ID in hexadecimal notation and separate the first four bytes (basic code) and the last four bytes (extended code) of the event ID by a colon (:). When entering hexadecimal notation, use uppercase A to F. Note that the last four bytes (the four bytes after the colon) can be omitted, in which case 0 is assumed for the omitted value. Zeros (0) are also inserted for any non-specified digits, beginning on the left side, if either the first or last four bytes have fewer than eight digits. Use a user-specifiable value from 0:0 to 1FFF:0 and 7FFF8000:0 to 7FFFFFFF:0. There can be no space or tab between `id=` and the value. However, there must be a space between *log-type* and *log-file-trap-name*. If you omit this value, event ID 00003A71 is assumed. Event ID format examples are provided below.

### Example:

The following three specifications have the same meaning:

0000011A:00000000

11A:0

11A

[trap-name=*log-file-trap-name*]

Specify a log file trap name to determine the corresponding filter for the registered JP1 event converted from the event log. The first character of *log-file-trap-name* must be an alphanumeric character. Uppercase and lowercase are distinguished. Do not add a space or tab. If this parameter is omitted, the extended attribute E.JP1\_TRAP\_NAME is not created at the time of JP1 event conversion.

### conditional-statement

The following explains the *conditional-statement*:

When a value other than *type* is specified for the attribute:

*attribute-specification regular-expression-1 regular-expression-2 regular-expression-3...*

When *type* is specified for the attribute

*type log-type-1 log-type-2 log-type-3...*

The above condition is satisfied if any of regular expressions (or log type) listed after the attribute specification exists. Note that the AND condition is applied to the conditional statements in the filter, and the OR condition is applied between filters.

### Attribute settings

The following table explains the attribute settings.

| Attribute name | Description   |
|----------------|---------------|
| type           | Log type      |
| source         | Source        |
| category       | Category      |
| id             | Event ID      |
| user           | User          |
| message        | Description   |
| computer       | Computer name |

### Note

When *message* is set as the attribute, an event log that contains Description related to xxx was not found (wording used when a message DLL is not found) as part of its description will not be able to generate a message. As a result, the log is excluded as a trap target. If character strings to be trapped are contained in the inserted paragraph, the log is not trapped.

In the above case, make sure that the message DLL mentioned in the event log description is properly configured in accordance with the Windows event log mechanism. If the message DLL is not properly configured, the log might fail to be trapped because the description cannot be read from the event log. If you want to trap a message with no message DLL, set the *matching-level* parameter to 1.

For details about the log information that can be monitored, see 8.6.3 *Log information that can be monitored* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

### Regular expressions

A regular expression is expressed as a character string enclosed in single quotation marks ( ' ) and is specified as 'xxxxx'. In the form ! ' . . . ', with an exclamation mark preceding the initial single quotation mark, the

character string is any string other than the specified character string. If you want to specify a single quotation mark ( ' ) as part of a regular expression, enter an escape sequence such as \ ' . Regular expressions can be specified only when the log type is not type.

## Log types

The following table lists and describes the log types.

| Log type      | Description      | Event level |
|---------------|------------------|-------------|
| Information   | Information      | Information |
| Warning       | Warning          | Warning     |
| Error         | Error            | Error       |
| Audit_success | Successful audit | Notice      |
| Audit_failure | Failed audit     | Notice      |

## Example definition

### Example definition 1: OR and AND conditions

#### Example definition for the OR condition

When the log type is *system log*, and TEXT, MSG, or -W is contained in the description.

```
filter "System"
  message 'TEXT' 'MSG' '-W'
end-filter
```

If you separate conditions with a space or a tab, the OR condition is applied.

#### Example definition for the AND condition

When the log type is *system log*, and TEXT, MSG, and -W are all contained in the description.

```
filter "System"
  message 'TEXT'
  message 'MSG'
  message '-W'
end-filter
```

If you separate conditions with a linefeed, the AND condition is applied. After a linefeed, start a new line with the attribute name.

### Example definition 2: Setting multiple filters

Trap event logs whose log type is *application log* and that satisfy the following condition:

#### *filter-1*

Type: Application log

Category: Error

Description: Contains -E and JP1/Base.

#### *filter-2*

Type: Application log

Category: Warning

Description: Contains -W or warning.

```
#filter-1
filter "Application"
```

```

        type Error
        message '-E'
        message 'JP1/Base'
    end-filter
#filter-2
filter "Application"
    type Warning
    message '-W' 'warning'
end-filter

```

### Example definition 3: Using regular expressions

Traps event logs that satisfy the following conditions:

- Type: Application log
- Category: Error
- Event ID: 111
- Description: Contains -E or MSG, but not TEXT.

```

filter "Application"
    type Error
    id '^111$'
    message '-E' 'MSG'
    message '!TEXT'
end-filter

```

If you want to set event ID 111 as a condition, specify the regular expression `id '^111$'`. Specifying `id '111'` creates a condition that means that *the value 111 is included in the ID*. Therefore, an event ID such as 1112 or 0111 satisfies the condition. If an exclamation mark (!) is inserted before the first single quotation mark, any data that does not match the specified regular expression is selected. The regular expression is fixed to the extended regular expression of JP1/Base. For details about extended regular expressions, see the description about the regular expression syntax in the *JP1/Base User's Guide*.

### Example definition 4: Do not convert specific event logs

Do not trap event logs whose log type is *system log*, whose event level is warning, and which satisfy the following conditions:

- Source: AAA
- Event ID: 111
- Description: Contains TEXT.

#Event logs for which source is AAA are not trapped.

```

filter "System"
    type Warning
    source '!AAA'
end-filter
#Event logs for which source is AAA, and event ID is a value other than 111 are trapped.
filter "System"
    type Warning
    source 'AAA'
    id '!^111$'
end-filter
#Event logs for which source is AAA and event ID is 111, but whose description does not include TEXT are trapped.
filter "System"

```

```
type Warning
source 'AAA'
id '^111$'
message !'TEXT'
end-filter
```

## 2.8 JP1/IM - Manager definition files (IM database)

---

### ◆ Setup information file (jimdbsetupinfo.conf)

#### Format

```
#IM DATABASE SERVICE - DB Size
IMDBSIZE=value
#IM DATABASE SERVICE - Data Storage Directory
IMDBDIR=value
#IM DATABASE SERVICE - Port Number
IMDBPORT=value
#IM DATABASE SERVICE - DB Install Directory
IMDBENVDIR=value
#IM DATABASE SERVICE - Host Name
IMDBHOSTNAME=value
```

#### File

jimdbsetupinfo.conf (setup information file)

jimdbsetupinfo.conf.model (model file for the setup information file)

#### Storage directory

In Windows

*Manager-path*\conf\imdb\setup\

In UNIX

/etc/opt/jplimm/conf/imdb/setup/

#### Description

This file specifies setup information, such as the size of the IM database and the directory for storing data for the IM database, when the integrated monitoring database and IM Configuration Management database are set up.

The setup information file is shared during setup of the integrated monitoring database and IM Configuration Management database. If you have set up one of the databases (integrated monitoring database or IM Configuration Management database) first and then are creating the other one, you must specify for the second database the same values as were specified for the first database.

The table below describes the approximate amount of disk space used per size of the IM database, which you must specify in the setup information file.

Note that, in addition to the areas described in the table below, approximately 0.2 gigabytes of free space is required in the directory in which to install the IM database (IMDBENVDIR), whatever the size of the IM database. For details about the specific amount of disk space used, see the Release Notes for JP1/IM - Manager. We recommend that you use the values provided in the Release Notes for JP1/IM - Manager when you estimate the amount of disk space used.

Table 2–87: Sizes of databases that are created

| Size | System database area <sup>#1, #2</sup> (gigabytes) | Integrated monitoring database area <sup>#1, #3</sup> (gigabytes) | IM Configuration Management database area <sup>#1, #4</sup> (gigabytes) | Total (gigabytes) |
|------|----------------------------------------------------|-------------------------------------------------------------------|-------------------------------------------------------------------------|-------------------|
| S    | 2                                                  | 9                                                                 | 2                                                                       | 13                |
| M    | 3                                                  | 33                                                                | 2                                                                       | 38                |
| L    | 7                                                  | 98                                                                | 11                                                                      | 116               |

#1

The system database area, the integrated monitoring database area, and the IM Configuration Management database area are created immediately under the database storage directory (IMDBDIR) specified in the setup information file.

#2

Area shared by the IM Configuration Management database and integrated monitoring database created during setup of the IM database.

#3

Area created when the `jcodbsetup` command is executed.

#4

Area created when the `jcfdbsetup` command is executed.

## When the definitions are applied

The contents of this file are loaded during setup and the IM database environment is configured based on the value specified for each item.

## Information that is specified

### IMDBSIZE

Specifies the size of the IM database to be created as the uppercase letter S, M, or L. The default is S.

### IMDBDIR

Specifies the absolute path of the directory in which data for the IM database is to be stored. JP1/IM creates the `imdb` directory immediately under the specified directory and then stores the IM database file (area). The default is as follows:

- In Windows: *Manager-path*\database  
An error results if a network drive or Windows reserved device file is specified. If the specified directory cannot be found, command execution fails. You must create the directory before executing the command.
- In UNIX: `/var/opt/jplimm/database`  
Specify a directory whose status is *mounted*. Do not specify a directory that is easily unmounted. If the directory is unmounted during operation, database startup and access will fail. If the specified directory cannot be found, command execution fails. You must create the directory before executing the command.  
For details about the necessary directory permissions, see [Table 2-88 Correspondence between OS and directory permissions](#).

The following explains the character string that can be used in the absolute path format:

- In Windows:  
A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `\`, `(`, `)`, and `.` (period). This character string must begin with the drive name.
- In UNIX:  
A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `/`, and `.` (period). This character string must begin with the path delimiter (`/`).

## IMDBPORT

Specifies the port number used by the IM database. The permitted value range is from 5001 to 65535. The default is 20700.

This port number must be different from any of the following port numbers:

- Port numbers specified when other logical hosts were set up
- Port numbers specified in the `services` file<sup>#</sup>
- Port numbers used in other products' HiRDB installation
- Temporary port numbers used by other products and the OS

<sup>#</sup>: Make sure that you do not specify the port number set in `IMDBPORT` in the `services` file.

## IMDBENVDIR

Specifies the absolute path of the directory in which the IM database is to be installed. Creates a directory under the specified directory (*JMn*: *n* matches `LOGICALHOSTNUMBER`), and then install the IM database.

- In Windows: *Manager-path*\dbms

An error results if a network drive or Windows reserved device file is specified. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.

- In UNIX: `/var/opt/jplimm/dbms`

Specify a directory that is in mounted status. Do not specify a directory that is easily unmounted. If the directory is unmounted during operation, database startup and access will fail. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command. In addition, do not specify a path that contains a symbolic link.

The following table explains the directory permissions.

Table 2–88: Correspondence between OS and directory permissions

| OS    | Permission                              |
|-------|-----------------------------------------|
| Linux | Owner: root<br>Group: root<br>Mode: 755 |

The following explains the character string that can be used in the absolute path format:

- In Windows:

A string of no more than 195 characters, consisting of alphanumeric characters, `_`, `\`, `(`, `)`, and the space. This character string must begin with the drive name.

- In UNIX:

A string of no more than 123 characters, consisting of alphanumeric characters, `_`, `/`, and `.` (period). This character string must begin with the path delimiter (`/`).

## IMDBHOSTNAME

Specifies the host name or the IP address to be used for communication with JP1/IM - MO and JP1/OA running on another host. If there is no linkage with JP1/IM - MO and JP1/OA on other hosts, do not define the line that specifies this item.

By default, a local host name is specified. If this value is omitted, the local host name is assumed. You can specify a maximum of 32 characters. Specifiable characters are alphanumeric characters, the hyphen (`-`), the underscore (`_`), the at mark (`@`), and the period (`.`).

## Example definition

```
#IM DATABASE SERVICE - DB Size
IMDBSIZE=S
#IM DATABASE SERVICE - Data Storage Directory
IMDBDIR=Manager-path\database
#IM DATABASE SERVICE - Port Number
IMDBPORT=20700
#IM DATABASE SERVICE - DB Install Directory
IMDBENVDIR=Manager-path\dbms
#IM DATABASE SERVICE - DB Host Name
IMDBHOSTNAME=
```

## ◆ Cluster setup information file (jimdbclustersetupinfo.conf)

### Format

```
#IM DATABASE SERVICE - Logical Host Number
LOGICALHOSTNUMBER=value
#IM DATABASE SERVICE - Logical Host Name
LOGICALHOSTNAME=value
#IM DATABASE SERVICE - DB Size
IMDBSIZE=S
#IM DATABASE SERVICE - Port Number
IMDBPORT=value
#IM DATABASE SERVICE - Data Storage Directory (Local Work Area)
IMDBDIR=Manager-path\db
#IM DATABASE SERVICE - Data Storage Directory (Shared Data Area)
SHAREDDBDIR=shared-directory\db
#IM DATABASE SERVICE - Online Host Name
ONLINEHOSTNAME=value
#IM DATABASE SERVICE - DB Install Directory
IMDBENVDIR=Manager-path\dbms
```

### File

jimdbclustersetupinfo.conf (cluster setup information file)

jimdbclustersetupinfo.conf.model (model file for the cluster setup information file)

### Storage directory

In Windows

*Manager-path*\conf\imdb\setup\

In UNIX

/etc/opt/jplimm/conf/imdb/setup/

### Description

This file specifies the IM database size for a logical host, or the directory for storing data of the IM database for a logical host when the integrated monitoring database and IM Configuration Management database are set up in a cluster environment.

The cluster setup information file is shared during setup of the integrated monitoring database and IM Configuration Management database. If you have set up one of the databases (integrated monitoring database or IM Configuration Management database) first and then are creating the other one, you must specify for the second database the same values as were specified for the first database. If you are configuring a cluster environment, when you set up the secondary node, copy the cluster setup information file used for the primary node. If you set up multiple logical hosts on the same host, you must copy `jimdbclustersetupinfo.conf` (cluster setup information file) under a different name and change the settings.

The table below describes the approximate amount of disk space used per size of the IM database, which you must specify in the cluster setup information file.

Note that, in addition to the areas described in the table below, approximately 0.2 gigabytes of free space is required in the directory in which to install the IM database (`IMDBENVDIR`), whatever the size of the IM database. For details about the specific amount of disk space used, see the Release Notes for JP1/IM - Manager. We recommend that you use the values provided in the Release Notes for JP1/IM - Manager when you estimate the amount of disk space used.

**Table 2–89: Sizes of databases that are created**

| Size | Local disk                                                  | Shared disk                                                  |                                                               |                                                                     |                   |
|------|-------------------------------------------------------------|--------------------------------------------------------------|---------------------------------------------------------------|---------------------------------------------------------------------|-------------------|
|      | System database area (local disk) <sup>#1</sup> (gigabytes) | System database area (shared disk) <sup>#2</sup> (gigabytes) | Integrated monitoring database area <sup>#2</sup> (gigabytes) | IM Configuration Management database area <sup>#2</sup> (gigabytes) | Total (gigabytes) |
| S    | 0.1                                                         | 2                                                            | 9                                                             | 2                                                                   | 13                |
| M    | 0.1                                                         | 3                                                            | 33                                                            | 2                                                                   | 38                |
| L    | 0.2                                                         | 7                                                            | 98                                                            | 11                                                                  | 116               |

#1

The system database area (local disk) is created immediately under the local database storage directory (`IMDBDIR`) specified in the cluster setup information file.

#2

The system database area (shared disk), the integrated monitoring database area, and the IM Configuration Management database area are created immediately under the shared database storage directory (`SHAREDDBDIR`) specified in the cluster setup information file.

## When the definitions are applied

The contents of this file are loaded during setup, and the IM database environment for a logical host is configured based on the value specified for each item.

## Information that is specified

### LOGICALHOSTNUMBER

Specify a value from 1 to 9 as the number to identify a logical host in the IM database for a logical host.

If you add a logical host, you must specify a different number. Specify the same number for both primary and secondary nodes.

### LOGICALHOSTNAME

Specify the name of a logical host. This must be a logical host name that can be resolved, and specified in the `jplcohasetup` and `jplcc_setup_cluster` commands. The IM database does not reference the `jplhosts` and `jplhosts2` files. Therefore, for `LOGICALHOSTNAME`, specify a logical host name whose name is in the `hosts` file or can otherwise be resolved using the OS's name resolution capability. You can specify a string of up to 32 characters that consist of half-width alphanumeric characters and hyphens (-).

The logical host name is case sensitive. As the logical host name, specify the logical host name set in JP1/Base in the correct format, especially case. For details on how to set up JP1/Base on a logical host, see the sections below in the *JP1/Integrated Management 3 - Manager Configuration Guide*:

- In Windows  
See 7.4.3(2) *Setting up JP1/Base*
- In UNIX  
See 8.4.3(2) *Setting up JP1/Base*

#### IMDBSIZE

Specify the size of the IM database for a logical host to be created by using uppercase letters S, M, or L. The default is S.

#### IMDBDIR

Specify the absolute path of the directory in which data of the IM database for a logical host is to be stored. Do not specify the shared disk in a cluster. JP1/IM creates the `imdb` directory immediately under the specified directory, and then stores the IM database file (for a local work area).

- In Windows:  
An error results if a network drive or Windows reserved device file is specified. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.
- In UNIX:  
Specify a directory that is in mounted status. Do not specify a directory that is easily unmounted. If the directory is unmounted during operation, database startup and access will fail. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.

The following table describes the directory permissions.

Table 2–90: Correspondence between OS and directory permissions

| OS    | Permission                              |
|-------|-----------------------------------------|
| Linux | Owner: root<br>Group: root<br>Mode: 755 |

The following shows the character string that can be used in the absolute path format:

- In Windows:  
A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `\`, `(`, `)`, and `.` (period). This character string must begin with the drive name.
- In UNIX:  
A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `/`, and `.` (period). This character string must begin with the path delimiter (`/`).

#### IMDBPORT

Specify the port number used by the IM database for a logical host. The permitted value range is from 5001 to 65535.

This port number must be different from any of the following port numbers:

- Port numbers specified when other logical hosts were set up
- Port numbers specified in the `services` file<sup>#</sup>
- Port numbers used in other products' HiRDB installation
- Temporary port numbers used by other products and the OS

#: Make sure that you do not specify the port number set in `IMDBPORT` in the `services` file.

#### SHAREDBDIR

Specifies the absolute path of the directory in which data of the IM database for a logical host that is shared by the primary and secondary nodes in a cluster configuration is to be stored. Specify a directory on a shared disk. JP1/IM creates the `imdb` directory immediately under the specified directory, and stores the IM database files (for the shared data area) for a logical host.

The following shows the character string that can be used in the absolute path format:

- In Windows:

A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `\`, `(`, `)`, and `.` (period). This character string must begin with the drive name.

An error results if a network drive or Windows reserved device file is specified. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.

- In UNIX:

A string of no more than 95 characters, consisting of alphanumeric characters, `_`, `/`, and `.` (period). This character string must begin with the path delimiter (`/`).

Specify a directory that is in mounted status. Do not specify a directory that is easily unmounted. If the directory is unmounted during operation, database startup and access will fail. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command. For details about the necessary directory permissions, see [Table 2-90 Correspondence between OS and directory permissions](#).

#### ONLINEHOSTNAME

Specifies the host name of the primary node. Specify a host name that can be resolved for the primary node. You can specify a string of up to 32 characters that consist of half-width alphanumeric characters, hyphens (`-`), and periods (`.`). The executing host name is also case sensitive. Specify the executing host name in the correct form, especially case.

#### IMDBENVDIR

Specify the absolute path of the directory in which the IM database for a logical host is to be installed. Do not specify a shared disk in the cluster. Create a directory (`JMn`: `n` matches `LOGICALHOSTNUMBER`) immediately under the specified directory, and then install the IM database for a logical host. The default is as follows:

- In Windows: *Manager-path* \dbms

An error results if a network drive or Windows reserved device file is specified. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.

- In UNIX: `/var/opt/jplimm/dbms`

Specify a directory that is in mounted status. Do not specify a directory that is easily unmounted. If the directory is unmounted during operation, database startup and access will fail. If the specified directory does not exist, command execution fails. Make sure that you create the directory before you execute the command.

For details about the necessary directory permissions, see [Table 2-90 Correspondence between OS and directory permissions](#).

The following shows the character string that can be used in the absolute path format: In addition, do not specify a path that contains a symbolic link.

- In Windows:

A string of no more than 195 characters, consisting of alphanumeric characters, `_`, `\`, `(`, `)`, and the space. This character string must begin with the drive name.

- In UNIX:

A string of no more than 123 characters, consisting of alphanumeric characters, `_`, `/`, and `.` (period). This character string must begin with the path delimiter (`/`).

## Example definition

```
#IM DATABASE SERVICE - Logical Host Number
LOGICALHOSTNUMBER=1
#IM DATABASE SERVICE - Logical Host Name
LOGICALHOSTNAME=host1
#IM DATABASE SERVICE - DB Size
IMDBSIZE=S
#IM DATABASE SERVICE - Data Storage Directory (Local Work Area)
IMBDBDIR=Manager-path\db
#IM DATABASE SERVICE - Port Number
IMDBPORT=20750
#IM DATABASE SERVICE - Data Storage Directory (Shared Data Area)
SHAREDDBDIR=shared-directory\db
#IM DATABASE SERVICE - Online Host Name
ONLINEHOSTNAME=host_H1
#IM DATABASE SERVICE - DB Install Directory
IMDBENVDIR=Manager-path\dbms
```

## 2.9 JP1/IM - Manager definition files (Intelligent Integrated Management Database)

---

### ◆ Intelligent Integrated Management Database setup information file (jimgndbsetupinfo.conf)

#### Format

```
#IM GNDATABASE SERVICE - Port Number
IMGNDDBPORT=port-number-for-intelligent-integrated-management-database
#TREND DATA MANEGEMENT SERVICE - Port Number
TDMSPORT=trend-data-management-service-port-number
#IM GNDATABASE SERVICE - Data Storage Directory
IMGNDDBDIR=data-storage-directory-for-intelligent-integrated-management-database
#IM GNDATABASE SERVICE - Data Base Binary
IMGNDDBENVDIR=directory-where-intelligent-integrated-management-database-is-installed
#IM GNDATABASE SERVICE - Retention
RETENTION=retention-period-of-time-series-data-in-trend-data-management-DB
#IM GNDATABASE SERVICE - Username
USERNAME=user-name-of-OS-used-to-start-intelligent-integrated-management-database
# TREND DATA DATABASE - MAX DISK SIZE [GB]
TDDBDISKMAX=max-disk-requirements-of-trend-data-management-database
# TREND DATA DATABASE - CUT-OFF TERM [Days]
TDDBCUTOFFTERM=truncation-duration-when-trend-data-is-deleted
```

#### File

jimgndbsetupinfo.conf#

jimgndbsetupinfo.conf.model (model file)

#: The installer creates it from a duplicate of the model file by deleting extension ".model".

#### Storage directory

In Windows

*Manager-path*\conf\imgndb\setup\

In UNIX

/etc/opt/jplimm/conf/imgndb/setup/

#### Description

A file that describes the definitions that are required during the setup of the Intelligent Integrated Management database.

#### Character code

ASCII (You cannot specify multi byte characters.)

## When the definitions are applied

At setup time (when the `jimgndbsetup` command is executed), the contents of this file are read and the environment of the intelligent integrated management database is built with the values specified for each item.

## Information that is specified

`IMGNDBPORT=port-number-for-intelligent-integrated-management-database`

Specifies port number used by the Intelligent Integrated Management database.

The port number specified must be unique for each host that Setup creates.

The default is 20705. If omitted, the default value is assumed.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. The extension of the command restarts the service and takes effect.

`TDMSPORT=trend-data-management-service-port-number`

Specifies the port number used by the Trend Data Management Service.

The port number that you specify must be unique for each system and host that Setup creates.

The default is 20706. If omitted, the default value is assumed.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. The extension of the command restarts the service and takes effect.

`IMGNDBDIR=data-storage-directory-for-intelligent-integrated-management-database`

Specifies the absolute path of the directory in which the data of the Intelligent Integrated Management database is stored.

- In Windows

Specify a character string of up to 100 single-byte alphanumeric characters, including "\_" (underscore), "\", "(", ")", and "." (period), and single-byte spaces.

- In Linux

Specify a character string of up to 100 single-byte alphanumeric characters, including "\_" (underscore), "/" (slash), and "." (period).

During setup, create an `imgndb` directory directly under the specified directory and build a trend data management DB. If the trend data management DB has already been built, it cannot be changed from the specified contents at the time of construction.

The defaults are following:

In Windows: *Manager-path*\database

In Linux: `/var/opt/jplimm/database`

If omitted, the default value is assumed.

`IMGNDBENVDIR=directory-where-intelligent-integrated-management-database-is-installed`

Specifies the absolute path of the directory where the Intelligent Integrated Management Database to be installed.

- In Windows

Specify a character string of up to 200 single-byte alphanumeric characters, including "\_" (underscore), "\", "(", ")", and "." (period), and single-byte spaces.

- In Linux

Specify a character string of up to 200 single-byte alphanumeric characters, including "\_" (underscore), "/" (slash), and "." (period).

During setup, `imgnadbbin` directory is created directly under the specified directory, and the Intelligent Integrated Management Database is expanded. If you have already built an Intelligent Integrated Management Database, you cannot change it from the specification at the time of construction.

The defaults are following:

In Windows: *Manager-path*\dbms

In Linux: `/var/opt/jplimm/dbms`

If omitted, the default value is assumed.

**RETENTION**=*retention-period-of-time-series-data-in-trend-data-management-DB*

Specify the retention period (unit: days) of the data stored in the trend data management DB.

The range is 1 to 1096.

The default is 32. If omitted, the default value is assumed.

If you want to change the setting during operation, change this value and run the `jimgnadbsetup` command. The extension of the command restarts the service and takes effect.

**USERNAME**=*user-name-of-OS-used-to-start-intelligent-integrated-management-database*

Specifies OS username from which the Intelligent Integrated Management Database is to be started in Linux (users who actually exist and are available for Login by users other than root). If specified in Windows configuration, it is ignored.

There is no default value. This specification is not optional.

If you want to change the setting during operation, change this value and run the `jimgnadbsetup` command. The extension of the command restarts the service and takes effect.

**TDDBDISKMAX**=*max-disk-requirements-of-trend-data-management-database*

Specifies the upper limit (in gigabytes) of the disk space required for Trend data Management Database. Automatic Delete occurs when Trend data Management Database disk requirements exceed 90% of this Value. If 0 is specified, the upper limit is not Setup.

The range is 0 or 10 to 131,072.

The default is 150. If the specification is omitted, the default Value is assumed.

If you want to change Setup during operation, change this Value and Execute `jimgnadbsetup` command. Restart the service with the extension of the command. It will be reflected.

Notes:

When using monitoring Trend data Management Database Disk Requirements feature, we recommend that you specify a Value that exceeds the 10-day data size of the trend data stored in Trend data Management Database.

**TDDBCUTOFFTERM**=*truncation-duration-when-trend-data-is-deleted*

Specifies the duration (in days) of the trend data to delete when trend data management database disk requirements reach 90% of the size specified for **TDDBDISKMAX**. If **TDDBDISKMAX** is 0, this field is ignored.

The range is 1 to 31.

The default is 7. If the specification is omitted, the default Value is assumed.

If you want to change setup during operation, change this value and Execute `jimgnadbsetup` command. Restart the service with the extension of the command. It will be reflected.

## Example definition

- In Windows

```
#IM GNDATABASE SERVICE - Port Number
IMGNDBPORT=20705
#TREND DATA MANEAGEMENT SERVICE - Port Number
TDMSPORT=20706
```

```
#IM GNDATABASE SERVICE - Data Storage Directory
IMGNDDBDIR=C:\Program Files (x86)\Hitachi\JP1IMM\database
#IM GNDATABASE SERVICE - Data Base Binary
IMGNDDBENVDIR=C:\Program Files (x86)\Hitachi\JP1IMM\dbms
# IM GNDATABASE SERVICE - Retention
RETENTION=32
# TREND DATA DATABASE - MAX DISK SIZE [GB]

# TREND DATA DATABASE - CUT-OFF TERM [Days]
TDDBCUTOFFTERM=truncation-duration-when-trend-data-is-deleted
```

## File

jimgnodbclustersetupinfo.conf<sup>#</sup>

jimgnodbclustersetupinfo.conf.model (model file)

<sup>#</sup>: The installer creates it from a duplicate of the model file by deleting extension ".model".

## Storage directory

In Windows

*Manager-path*\conf\imgnodb\setup\

In UNIX

/etc/opt/jplimm/conf/imgnodb/setup/

## Description

This file describes the definitions required when setting up a clustered environment for the Intelligent Integrated Management database.

## Character code

ASCII (You cannot specify multi byte characters.)

## When the definitions are applied

When setting up a clustered environment (when execution of jimgnodbsetup command (with -h option specified)), this file is read and value specified for the items builds Intelligent Integrated Management Database environment for logical host.

## Information that is specified

LOGICALHOSTNAME=*logical-host-name-of-the-intelligent-integrated-management-database*

Specifies the logical host name of the Intelligent Integrated Management database.

You can specify a character string of up to 63 bytes consisting of single-byte alphanumeric characters and hyphens (-). Uppercase and lowercase letters are sensitive.

If the value is empty or omitted, the value specified on the -h option of the jimgnodbsetup command is used when the jimgnodbsetup command is run.

Also, the logical host name must be a host name that can be resolved on the OS.

There is no default value.

IMGNDBPORT=*port-number-for-intelligent-integrated-management-database*

Specifies port number used by Intelligent Integrated Management Database.

The port number specified must be unique for each host that Setup creates.

There is no default value. This specification is not optional.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. In a logical host environment, the service remains stopped rather than restarted due to command extensions, so you must manually start the service after running the command.

`TDMSPORT=trend-data-management-service-port-number`

Specifies the port number used by the Trend Data Management Service.

The port number that you specify must be unique for each system and host that Setup creates.

There is no default value. This specification is not optional.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. In a logical host environment, the service remains stopped rather than restarted due to command extensions, so you must manually start the service after running the command.

`SHAREGNBDBDIR=data-storage-directory-for-intelligent-integrated-management-database`

Specifies the absolute-path directory on the shared disk of the cluster environment where Intelligent Integrated Management Database for Logical host is stored.

- In Windows  
Specify a character string of up to 100 single-byte alphanumeric characters, including "\_" (underscore), "\", "(", ")", and "." (period), and single-byte spaces.
- In Linux  
Specify a character string of up to 100 single-byte alphanumeric characters, including "\_" (underscore), "/" (slash), and "." (period).

During setup, a directory with `imgndb+logical-host-number` is created directly under the specified directory, and Intelligent Integrated Management Database is constructed. If you have already built Intelligent Integrated Management Database, you cannot change it from the specification at the time of the build.

There is no default value. This specification is not optional.

`IMGNDBENVDIR=directory-where-intelligent-integrated-management-database-is-installed`

Specifies the absolute-path directory on the local disk where you want to install Intelligent Integrated Management Database for Logical host. Do not specify a shared disk in a clustered environment.

- In Windows  
Specify a character string of up to 200 single-byte alphanumeric characters, including "\_" (underscore), "\", "(", ")", and "." (period), and single-byte spaces.
- In Linux  
Specify a character string of up to 200 single-byte alphanumeric characters, including "\_" (underscore), "/" (slash), and "." (period).

When setting up, create a directory of `imgndbbin+logical-host-number` directly under the specified directory, and extract Intelligent Integrated Management Database. If you have already built Intelligent Integrated Management Database, you cannot change it from the specification at the time of the build.

The defaults are following:

In Windows: `Manager-path\dbms`

In Linux: `/var/opt/jplimm/dbms`

If omitted, the default value is assumed.

`LOGICALHOSTNUMBER=logical-host-number`

Specifies the number to identify Logical host in Intelligent Integrated Management Database for logical host as a one-byte number from 1 to 9.

If you are adding a logical host, you cannot specify the same number as a number that already exists.

Specify the same number for the execution system and the standby system.

If you have already built Intelligent Integrated Management Database, you cannot change it from the specification at the time of the build.

There is no default value. This specification is not optional.

**RETENTION**=*retention-period-of-time-series-data-in-trend-data-management-DB*

Specify the retention period (unit: days) of the data stored in the trend data management DB.

The range is 1 to 1096.

The default is 32. If omitted, the default value is assumed.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. In a logical host environment, the service remains stopped rather than restarted due to command extensions, so you must manually start the service after running the command.

**USERNAME**=*user-name-of-OS-used-to-start-intelligent-integrated-management-database*

Specifies OS username under which Intelligent Integrated Management Database is launched in Linux, that is, the user who actually exists for a user other than root and who can login it. If specified in Windows configuration, it is ignored.

There is no default value. This specification is not optional.

If you want to change the setting during operation, change this value and run the `jimgndbsetup` command. In a logical host environment, the service remains stopped rather than restarted due to command extensions, so you must manually start the service after running the command.

**TDDBDISKMAX**=*max-disk-requirements-of-trend-data-management-database*

Specifies the upper limit (in gigabytes) of the disk space required for Trend data Management Database. Automatic Delete occurs when Trend data Management Database disk requirements exceed 90% of this Value. If 0 is specified, the upper limit is not Setup.

The range is 0 or 10 to 131,072.

The default is 150. If the specification is omitted, the default value is assumed.

If you want to change setup during operation, change this value and execute `jimgndbsetup` command. Restart the service with the extension of the command. It will be reflected.

#### Notes

When using Monitoring Trend data Management Database Disk Requirements feature, we recommend that you specify a value that exceeds the 10-day data size of the trend data stored in Trend data Management Database.

**TDDBCUTOFFTERM**=*truncation-duration-when-trend-data-is-deleted*

Specifies the duration (in days) of the trend data to delete when Trend data Management Database disc requirements reach 90% of the size specified for **TDDBDISKMAX**. If **TDDBDISKMAX** is 0, this field is ignored.

The range is 1 to 31.

The default is 7. If the specification is omitted, the default value is assumed.

If you want to change setup during operation, change this value and execute `jimgndbsetup` command. Restart the service with the extension of the command. It will be reflected.

## Example definition

- In Windows

```
#IM DATABASE SERVICE - Logical Host Number
LOGICALHOSTNUMBER=1

## ◆ Intelligent Integrated Management Database configuration file (postgresql.conf)

### Format

```

parameter = settings-in-JP1/IM - Manager
parameter = settings-in-JP1/IM - Manager
:
parameter = settings-in-JP1/IM - Manager

```

### File

postgresql.conf

postgresql.conf.model (model file)

## Storage directory

In Windows:

- For a physical host  
*Manager-path*\conf\imgndb\
- For a logical host  
*shared-folder*#\jplimm\conf\imgndb\

In Linux:

- For a physical host  
*/etc/opt/jplimm/conf/imgndb/*
- For a logical host  
*shared-directory*#/jplimm/conf/imgndb/

#:

JP1/IM - Directory on the shared disk specified when building the Manager's logical host environment (directory specified separately for each logical host)

## Description

This file describes parameter definitions related to the Intelligent Integrated Management Database (PostgreSQL).

## When the definitions are applied

If you change the parameter settings, you must restart the Intelligent Integrated Management database.

In addition, some parameters are automatically populated when the Intelligent Integrated Administration database is set up to match the resource status of the operating environment.

## Information that is specified

*parameter = settings-in-JP1/IM - Manager*

The parameters that can be set are the same as those provided by PostgreSQL.

The parameters that can be edited by the user are listed in the following table:

| Parameter              | Type    | Description                                                                                                                                                                                      | Settings in JP1/IM - Manager |
|------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| authentication_timeout | integer | Sets the maximum time to complete client authentication.<br>This parameter can only be set in the postgresql.conf file or on the server command line.                                            | 1min                         |
| log_filename           | string  | If logging_collector parameter is in effect, sets the file name of the log file created.<br>This parameter can only be set in the postgresql.conf file or on the server command line.            | 'postgresql-%a.log'          |
| log_rotation_age       | integer | If the logging_collector parameter is in effect, sets the maximum time to use individual log files.<br>This parameter can only be set in the postgresql.conf file or on the server command line. | 1d                           |
| log_rotation_size      | integer | If logging_collector parameter is in effect, sets the maximum size of an individual log file.<br>This parameter can only be set in the postgresql.conf file or on the server command line.       | --                           |

| Parameter               | Type   | Description                                                                            | Settings in JP1/IM - Manager |
|-------------------------|--------|----------------------------------------------------------------------------------------|------------------------------|
| log_min_messages        | enum   | Sets the level of messages written to the server log.                                  | warning                      |
| log_min_error_statement | enum   | Set whether SQL statements that cause error conditions are recorded in the server log. | error                        |
| log_line_prefix         | string | Sets the printf-style string that is output at the beginning of each log line.         | '%m [%p] %e'                 |
| lc_messages             | string | Sets the language in which the message is displayed.                                   | 'C'                          |
| lc_monetary             | string | Use the to_char family of functions to set the locale used to format amounts.          | 'C'                          |
| lc_numeric              | string | Use the to_char family of functions to set the locale used to format numbers.          | 'C'                          |
| lc_time                 | string | Use the to_char family of functions to set the locale used to format dates and times.  | 'C'                          |

Legend:

--: Do not use JP1/IM - Manager.

## 2.10 JP1/IM - Manager definition files (Product plug-ins of JP1/IM - Agent)

### ◆ Node exporter metric definition file (metrics\_node\_exporter.conf)

#### Format

```
[
  {
    "name": "trend-data-metric-names",
    "default": default-selection-state,
    "promql": "PromQL-statement",
    "resource_en": {
      "category": "metric-category- (English)",
      "label": "metric-display-name- (English)",
      "description": "metric-description- (English)",
      "unit": "metric-unit- (English)"
    },
    "resource_ja": {
      "category": "metric-category- (Japanese)",
      "label": "metric-display-name- (Japanese)",
      "description": "metric-description- (Japanese)",
      "unit": "metric-unit- (Japanese)"
    },
    "drop_legend_labels": ["label-name", ...]
  }, ...
] #
```

#

The number of elements that can be described in [ ] is 1 to 1,000. If an out-of-range number of elements is described, a KAJY24609-E error message is output.

#### File

metrics\_node\_exporter.conf

metrics\_node\_exporter.conf.model (model file)

#### Storage directory

##### ■Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

In Linux:

- For a physical host  
*/etc/opt/jplimm/conf/imdd/plugin/jplpccs/*
- For a logical host

## Description

This file defines the metric information of Node exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of `__metricListGet` method and `__timeSeriesDataGet` method of the JP1/IM - Agent product plug-in.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

Table 2–91: Values to set for each member of the metrics definition file

| Member name | Optional | Type    | Value to set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | No       | string  | <p>Set trend data metric names.</p> <p>The metric name of trend data (time series data) is displayed as a character string indicating the type of trend data on the Trend tab of the Unified Operation Viewer screen.</p> <p>1 to 255 characters, and the following characters can be specified.</p> <ul style="list-style-type: none"> <li>• Single-byte alphanumeric characters</li> <li>• - (hyphen)</li> <li>• _ (underscore)</li> </ul> <p>If it contains characters that cannot be specified, a KAJY24604-E or KAJY24605-E error message is printed.</p> <p>The metric name must be unique within the metric definition file.</p> <p>Otherwise, a KAJY24608-E error message is output.</p> |

| drop_legend_labels |             | Yes      | Array (string) | Set the label name if you want to add a label that you want to exclude from the trend chart legend.<br>In addition to the labels to be excluded shown in 3.15.6(4)(b) <i>Instance name (a string to display as a legend in the graph)</i> of the <i>JP1/Integrated Management 3 - Manager Overview and System Design Guide</i> , the names of labels to be excluded from the legend of the trend graph are described.<br>Specify 1 to 255 characters except control characters (0x00 to 0x1F, 0x7F to 0x9F).<br>If it contains characters that cannot be specified, it is not excluded from the legend of the trend graph.<br>You can specify up to 100 labels. If there are more than 100 labels, the 101st and subsequent labels are ignored. |

#### ■Replacing \$jp1im\_TrendData\_labels

The string "\$jp1im\_TrendData\_labels" in the promql value is replaced with a PromQL statement to narrow down the target of retrieval when retrieving performance data.

The following is the replaced PromQL statement for each SID type of configuration information specified in the Trending API or Unified Operations Viewer (for CloudWatchSIDs other than EC2, for each monitored AWS namespace). The bold part (variable value) is replaced by the Exporter setting managed by the corresponding SID or the sample value output by the Exporter.

Table 2–92: PromQL statement after replacing \$jp1im\_TrendData\_labels

| Configuration information SID type | PromQL statement after replacement                                                                                                                                                                                                              |

## ◆ Process exporter metric definition file (metrics\_process\_exporter.conf)

### Syntax

The same as the JP1/IM - Agent Node exporter metric definition file.

### File

metrics\_process\_exporter.conf

metrics\_process\_exporter.conf.model (model file)

### Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs/

When using a logical host

*shared-directory*/jplimm/conf/imdd/plugin/jplpccs/

### Description

This file defines the metric information of Process exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins. If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

### Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

The same as the JP1/IM - Agent Node exporter metric definition file.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the Process exporter metric definition file (model file).

- process\_pgm\_process\_count<sup>#</sup>
  - Settings (initial status)

|                                                                               | label       | Process count                                                                                                                               |
|                                                                               | description | Number of processes that are executing programs. Number of processes that have this program name inside the process table.                  |
|                                                                               | unit        | count                                                                                                                                       |

#  
This is equivalent to the Start Time Process Count (PROCESS\_COUNT) field in the JP1/PFM - Agent for Platform (UNIX) PD\_PGM record.

## ◆ Node exporter (service monitoring) metric definition file (metrics\_node\_exporter\_service.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_node\_exporter\_service.conf

metrics\_node\_exporter\_service.conf.model (model file)

## Storage directory

- Integration Manager host

For Windows

- When using a physical host  
`Manager-path\conf\imdd\plugin\jplpccs\`
- When using a logical host  
`shared-folder\jplimm\conf\imdd\plugin\jplpccs\`

For Linux

- When using a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- When using a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

Used to get the trend with the service monitoring function of Linux. For details about the service monitor feature, see *Specifying monitored services in 3.15.1(1)(d) Node exporter (Linux performance data collection capability)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

This definition file defines metric information that can be retrieved by IM management node of the service.

If JP1/IM - Manager is in a hierarchical configuration and you want the Integration Manager to refer to trend data stored in Trend data Management Database of lower manager, you must add the referenced trend data metrics to the Integration Manager metric definition file.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See Content description in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#) in (2. Definition Files) JP1/IM - Agent.

## ◆ Windows exporter metric definition file (metrics\_windows\_exporter.conf)

### Format

See the *Format* section in *Node exporter metric definition file (metrics\_node\_exporter.conf)*.

### File

metrics\_windows\_exporter.conf

metrics\_windows\_exporter.conf.model (model file)

### Storage directory

#### ■ Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

In Linux:

- For a physical host  
/etc/opt/jplimm/conf/imdd/plugin/jplpccs/
- For a logical host  
*shared-directory*/jplimm/conf/imdd/plugin/jplpccs/

## Description

This file defines the metric information of Windows exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of JP1/IM - \_\_metricListGet method and \_\_timeSeriesDataGet method of the agent product plug-in.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See the *Information that is specified* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model file settings (initial state)

The setting contents (initial state) of each metric described in the model file of the Windows exporter metric definition file are shown below.

JP1/PFM - Equivalent to the Pkts Rcvd/sec field in the Agent for Platform (Windows) PI\_NETI record.

## ◆ Windows exporter (process monitoring) metric definition file (metrics\_windows\_exporter\_process.conf)

### Syntax

The same as the JP1/IM - Agent Windows exporter metric definition file.

### File

metrics\_windows\_exporter\_process.conf

metrics\_windows\_exporter\_process.conf.model (model file)

### Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs/

When using a logical host

*shared-directory*/jplimm/conf/imdd/plugin/jplpccs/

### Description

This file defines the metric information of Windows exporter (process monitoring) displayed on the **Trends** tabbed page of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins. If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

The same as the JP1/IM - Agent Windows exporter metric definition file.

## Content description

The same as the JP1/IM - Agent Windows exporter metric definition file.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the Windows exporter (process monitoring) metric definition file (model file).

- process\_pgm\_process\_count<sup>#</sup>
  - Settings (initial status)

#

This has no equivalent field in JP1/PFM - Agent for Platform (Windows). This is equivalent to the PROCESS\_COUNT field (addition for alive monitoring) in the JP1/PFM - Agent for Platform (UNIX) PD\_PGM record.

## ◆ Windows exporter (service monitoring) metric definition file (metrics\_windows\_exporter\_service.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## File

`metrics_windows_exporter_service.conf`

`metrics_windows_exporter_service.conf.model` (model file)

## Storage directory

- Integration Manager host

For Windows

- When using a physical host  
`Manager-path\conf\imdd\plugin\jplpccs\`
- When using a logical host  
`shared-folder\jplimm\conf\imdd\plugin\jplpccs\`

For Linux

- When using a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- When using a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

Used to get the trend with the service monitoring function of Windows. For details about the service monitor function, see *Specifying monitored services* in 3.15.1(1)(c) *Windows exporter (Windows performance data collection capability)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

This definition file defines metric that can be retrieved by IM management node of the service.

If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See Content description in *Node exporter metric definition file (metrics\_node\_exporter.conf)* in (2. Definition Files) JP1/IM - Agent.

## Settings in the model file (initial status)

## ◆ Windows exporter (Hyper-V monitoring) metric definition file for host (metrics\_windows\_exporter\_hyperv\_host.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_windows\_exporter\_hyperv\_host.conf

metrics\_windows\_exporter\_hyperv\_host.conf.model (model file)

### Storage destination directory

- Integration Manager host

For Windows

- For a physical host  
*Manager-path*\conf\imdd\plugin\jp1pccs\
  - When the logical host  
*Shared-folder*\jp1imm\conf\imdd\plugin\jp1pccs\
    - For a physical host

For Linux

- For a physical host

```
/etc/opt/jplimm/conf/imdd/plugin/jplpccs/
```

- When the logical host

*Shared-directory/jplimm/conf/imdd/plugin/jplpccs/*

## Description

This file defines metric for the host in Windows exporter (Hyper-V monitoring) displayed in the **Trend** tab, **Dashboard** tab, and **Dashboard List** dialog box of Integrated Operation Viewer window.

Defined content is used for the `__metricListGet` method of product plugin in JP1/IM - Agent and the return value of the `__timeSeriesDataGet` method.

If JP1/IM - Manager is in a hierarchical configuration and you want the Integration Manager to refer to trend data stored in Trend data Management Database of lower manager, you must add the referenced trend data metrics to the Integration Manager metric definition file.

## Character code

UTF-8 (without BOM)

## Line feed code

For Windows: CR+LF

For Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See *Content description* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## ◆ Windows exporter (Hyper-V monitoring) metric definition file for VM (metrics\_windows\_exporter\_hyperv\_vm.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_windows\_exporter\_hyperv\_vm.conf

metrics\_windows\_exporter\_hyperv\_vm.conf.model (model file)

### Storage destination directory

- Integration Manager host

For Windows

- For a physical host  
*Manager-path*\conf\imdd\plugin\jp1pccs\
- When the logical host  
*Shared-folder*\jp1imm\conf\imdd\plugin\jp1pccs\

For Linux

- For a physical host  
/etc/opt/jp1imm/conf/imdd/plugin/jp1pccs/
- When the logical host  
*Shared-directory*/jp1imm/conf/imdd/plugin/jp1pccs/

### Description

This file defines metric for VM of Windows exporter (Hyper-V monitoring) displayed in the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of Integrated Operation Viewer window.

Defined content is used for the `__metricListGet` method of product plugin in JP1/IM - Agent and the return value of the `__timeSeriesDataGet` method.

If JP1/IM - Manager is in a hierarchical configuration and you want the Integration Manager to refer to trend data stored in Trend data Management Database of lower manager, you must add the referenced trend data metrics to the Integration Manager metric definition file.

## Character code

UTF-8 (without BOM)

## Line feed code

For Windows: CR+LF

For Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See Content description in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model file settings (default)

The following table shows the settings (initial status) of metric described in the model file of Windows exporter (Hyper-V monitoring) metric definition file for VM.

- hyperv\_vm\_device\_written<sup>#</sup>
  - Setting contents (default)

| Member name                                                           |             | Setting contents (default)                                                             |
|-----------------------------------------------------------------------|-------------|----------------------------------------------------------------------------------------|

## ◆ Node exporter for AIX metric definition file (metrics\_node\_exporter\_aix.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_node\_exporter\_aix.conf

metrics\_node\_exporter\_aix.conf.model (model file)

### Storage directory

- Integration Manager host

For Windows

- When using a physical host  
*Manager-path*\conf\imdd\plugin\jp1pccs\
- When using a logical host  
*shared-folder*\jp1imm\conf\imdd\plugin\jp1pccs\

For Linux

- When using a physical host

```
/etc/opt/jplimm/conf/imdd/plugin/jplpccs/
```

- When using a logical host

```
shared-directory/jplimm/conf/imdd/plugin/jplpccs/
```

## Description

This file defines the metric information of Node exporter for AIX displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins.

If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See Content description in *Node exporter metric definition file (metrics\_node\_exporter.conf)* in (2. Definition Files) JP1/IM - Agent.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the Node exporter for AIX metric definition file.

- `cpu_used_rate`<sup>#</sup>
  - Settings (initial status)

## ◆ Blackbox exporter metric definition file (metrics\_blackbox\_exporter.conf)

## Format

```
[
{
  "name": "trend-data-metric-names",
  "default": default-selection-state
  "promql": "PromQL-statement",
  "resource_en": {
    "category": "metric-category-(English)",
    "label": "metric-display-name-(English)",
    "description": "metric-description-(English)",
    "unit": "metric-unit-(English)"
  },
  "resource_ja": {
    "category": "metric-category-(Japanese)",
    "label": "metric-display-name-(Japanese)",
    "description": "metric-description-(Japanese)",
    "unit": "metric-unit-(Japanese)"
  },
  "module": "module name",
  "drop_legend_labels": ["label name", ...]
}, ...
]#
```

#

The number of elements that can be described in [] is 1 to 1,000. If an out-of-range number of elements is described, a KAJY24609-E error message is output.

## File

metrics\_blackbox\_exporter.conf

```
metrics blackbox exporter.conf.model (model file)
```

## Storage directory

- Integrated manager host

### In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

In Linux:

- For a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- For a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

This file defines the metric information of Blackbox exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of `__metricListGet` method and `__timeSeriesDataGet` method of the JP1/IM - Agent product plug-in.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

The following value is setup to `module` membership. For values that setup to other members, see the *Information that is specified* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

Table 2–93: Value to setup for module members of metric definition File

| Member name | Optional | Type   | Value to set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| module      | Yes      | string | <p>Set the value of module of the IM management node that returns this metric to a string that matches the forward.</p> <p>This member is optional for Blackbox exporter metrics definition files only.</p> <p>Specify 1~255 characters except control characters (0x00~0x1F, 0x7F~0x9F).</p> <p>If it contains characters that cannot be specified, a KAJY24604-E or KAJY24605-E error message is printed.</p> <p>If omitted, this metric is returned for all remote agent SIDs of the Blackbox exporter.</p> <p>The IM management node's module value is the value specified for module in the Prometheus configuration file (<code>jpc_prometheus_server.yml</code>) scrape job. This value is also displayed in the Module property of the Blackbox exporter's Remote Agent SID.</p> <p>Example 1: http</p> <p>Example 2: ICMP</p> |

## Model file settings (initial state) and alert definition example

The setting contents (initial state) and alert definition example (alert setting file) of each metric described in the model file of the Blackbox exporter metric definition file are shown below.

- probe\_success
  - Configuration contents (default status)

| Member name                                                                |             | Configuration contents (default status)         |

## ◆ Yet another cloudwatch exporter metric definition file (metrics\_ya\_cloudwatch\_exporter.conf)

### Format

```
[
  {
    "name": "trend-data-metric-names",
    "default": default-selection-state,
    "promql": "PromQL-statement",
    "resource_en": {
      "category": "metric-category- (English)",
      "label": "metric-display-name- (English)",
      "description": "metric-description- (English)",
      "unit": "metric-unit- (English)"
    },
    "resource_ja": {
      "category": "metric-category- (Japanese)",
      "label": "metric-display-name- (Japanese)",
      "description": "metric-description- (Japanese)",
      "unit": "metric-unit- (Japanese)"
    },
    "cloud_srv": "AWS service namespace name",
    "drop_legend_labels": ["label-name", ...]
  }, ...
] #
```

#

The number of elements that can be described in [] is 1 to 1,000. If an out-of-range number of elements is described, a KAJY24609-E error message is output.

### File

metrics\_ya\_cloudwatch\_exporter.conf

metrics\_ya\_cloudwatch\_exporter.conf.model (model file)

## Storage directory

### ■Integrated manager host

In Windows:

- For a physical host  
*Manager-path\conf\imdd\plugin\jplpccs\*
- For a logical host  
*shared-folder\jplimm\conf\imdd\plugin\jplpccs\*

In Linux:

- For a physical host  
*/etc/opt/jplimm/conf/imdd/plugin/jplpccs/*
- For a logical host  
*shared-directory/jplimm/conf/imdd/plugin/jplpccs/*

## Description

This file defines the metric information of Yet another cloudwatch exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of `__metricListGet` method and `__timeSeriesDataGet` method of the JP1/IM - Agent product plug-in.

IM management nodes for Yet another cloudwatch exporter are created only for resources for metrics defined in the Yet another cloudwatch exporter metrics definition file.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

IM management nodes in Yet another cloudwatch exporter are reflected when you run the `jddcreatetree` and `jddupdatetree` commands.

## Information that is specified

The following value is setup to name and cloud\_srv membership. For values that setup to other members, see the *Information that is specified* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

Table 2–94: Values to set for the name and cloud\_srv members of the metric definition file

| Member name | Optional | Type   | Value to set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | No       | string | <p>Set the metric name for the trend data.</p> <p>The metric name of trend data (time series data) is displayed as a character string indicating the type of trend data on the Trend tab of the Unified Operation Viewer screen.</p> <p>For yet another cloudwatch exporter metrics definition file, create only resources for the metrics defined here. Also, the metric name must match the metric name in Yet another cloudwatch exporter.</p> <p>1 to 255 characters, and the following characters can be specified.</p> <ul style="list-style-type: none"><li>• Single-byte alphanumeric characters</li><li>• - (hyphen)</li><li>• _ (underscore)</li></ul> <p>If it contains characters that cannot be specified, a KAJY24604-E or KAJY24605-E error message is printed.</p> <p>The metric name must be unique within the metric definition file. ## ◆ Promitor metric definition file (metrics\_promitor.conf)

### Syntax

The same as the JP1/IM - Agent Node exporter metric definition file.

### File

metrics\_promitor.conf

metrics\_promitor.conf.model (model file)

### Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\_azure\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\_azure\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs\_azure/

When using a logical host

*shared-directory*/jplimm/conf/imdd/plugin/jplpccs\_azure/

### Description

This file defines the metric information of Promitor displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the \_\_metricListGet method and \_\_timeSeriesDataGet method for JP1/IM - Agent product plug-ins.

The Promitor IM management node is only created for metric resources defined in the Promitor metric definition file. If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

For the Promitor IM management node, definitions are reflected when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

The same as the JP1/IM - Agent Node exporter metric definition file.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the Promitor metric definition file (model file).

- `azure_virtual_machine_disk_read_bytes_total`
  - Settings (initial status)

## ◆ Script exporter metric definition file (metrics\_script\_exporter.conf)

### Syntax

The same as the JP1/IM - Agent Node exporter metric definition file.

### File

metrics\_script\_exporter.conf

metrics\_script\_exporter.conf.model (model file)

## Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs/

When using a logical host

*shared-directory*/jplimm/conf/imdd/plugin/jplpccs/

## Description

This file defines the metric information of Script exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins. If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

For the Script exporter IM management node, definitions are reflected when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

See *Content description* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#) in (2. Definition Files) JP1/IM - Agent.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the Script exporter metric definition file (model file).

- `azure_virtual_machine_disk_read_bytes_total`

- Settings (initial status)

| Member                                                                     |             | Setting (initial status)                    |

## ◆ Fluentd metric definition file (metrics\_fluentd.conf)

### Format

See the *Format* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## File

`metrics_fluentd.conf`

`metrics_fluentd.conf.model` (model file)

## Storage directory

### ■Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

In Linux:

- For a physical host  
*/etc/opt/jplimm/conf/imdd/plugin/jplpccs/*
- For a logical host  
*shared-directory/jplimm/conf/imdd/plugin/jplpccs/*

## Description

This file defines the metric information of Fluentd displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Defined content is used for the `__metricListGet` method of product plugin in JP1/IM - Agent and the return Value of the `__timeSeriesDataGet` method.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See the *Information that is specified* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model File's Configuration contents (Default status)

Configuration contents (default status) of metric described in file of Fluentd metric definition file is shown below.

- fluentd\_logtrap\_running
  - Configuration contents (default status)

## ◆ OracleDB exporter metric definition file (metrics\_oracledb\_exporter.conf)

### Syntax

See *Syntax* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_oracledb\_exporter.conf

metrics\_oracledb\_exporter.conf.model (model file)

### Storage directory

- Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jp1pccs\
  - For a logical host

`shared-folder\jplimm\conf\imdd\plugin\jplpccs\`

In Linux:

- For a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- For a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

This file defines the metric information of OracleDB exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins.

If JP1/IM - Manager is in a hierarchical configuration and you want the integrated manager to refer to trend data stored in trend data management database of lower manager, you must add the referenced trend data metrics to the integrated manager metric definition file.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See *Content description* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#) in (2. Definition Files) JP1/IM - Agent.

## Model file settings (initial state)

The following shows the settings (initial status) of each metric written in the OracleDB exporter metric definition file.

- `oracledb_up`  
- Settings (initial status)

## ◆ OracleDB exporter default collection metric definition file (default-metrics.toml)

### Format

A TOML format file.

See GitHub website for the format of this file.

### File

default\_metrics.toml

default\_metrics.toml.model (model file)

### Storage directory

- Integrated agent host (model files only)

In Windows:

- For a physical host

**Windows versions of OracleDB exporter archived file #** are extracted  
to `\oracledb_exporter_windows\conf\`

#

*Agent path*\options\oracledb\_exporter\_windows\_VVRRSS.zip

In Linux:

- For a physical host

**Linux versions of OracleDB exporter archived file #** are extracted to /  
`oracledb_exporter_linux/conf/`

#

`/opt/jplima/options/oracledb_exporter_linux_VVRRSS.tar.gz`

## Description

This file defines the metrics that OracleDB exporter retrieves.

This file cannot be edited.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

This is applied when OracleDB exporter is started or restarted.

## Description

See GitHub website for the format of this file.

## ◆ Web exporter metric definition file (metrics\_web\_exporter.conf)

### Format

See *Format* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

`metrics_web_exporter.conf`

`metrics_web_exporter.conf.model` (model file)

## Storage directory

■ Integrated manager host

In Windows:

- For a physical host  
`Manager-path\conf\imdd\plugin\jplpccs\`
- For a logical host  
`shared-folder\jplimm\conf\imdd\plugin\jplpccs\`

In Linux:

- For a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- For a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

This file defines the metric information of Web exporter displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of `__metricListGet` method and `__timeSeriesDataGet` method of the JP1/IM - Agent product plug-in.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See *Information that is specified* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model file settings (initial state)

The setting contents (initial state) of each metric described in the model file of the Web exporter metric definition file are shown below.

- `probe_webscena_success`<sup>#</sup>
  - Configuration contents (default status)

| Member name | Configuration contents (default status) |

Equivalent to Host Physical Disk Status\_Write Speed (WRITE\_SPEED) field in JP1/PFM - RM for Virtual Machine.

## ◆ VMware exporter metric definition file for VM (metrics\_vmware\_exporter\_vm.conf)

### Format

See *Format* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_vmware\_exporter\_vm.conf

metrics\_vmware\_exporter\_vm.conf.model (model file)

### Storage directory

- Integrated manager host

In Windows:

- For a physical host  
`Manager-path\conf\imdd\plugin\jplpccs\`
- For a logical host  
`shared-folder\jplimm\conf\imdd\plugin\jplpccs\`

In Linux:

- For a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs/`
- For a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs/`

## Description

This file defines the metric information for VMs in VMware exporter to be displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

The defined contents are used for the return values of `__metricListGet` method and `__timeSeriesDataGet` method of the JP1/IM - Agent product plug-in.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See *Information that is specified* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model file settings (initial state)

The setting contents (initial state) of each metric described in the model file of the VM exporter metric definition file are shown below.

## ◆ SQL exporter metric definition file (metrics\_sql\_exporter.conf)

### Format

See *Format* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

metrics\_sql\_exporter.conf

metrics\_sql\_exporter.conf.model (model file)

### Storage destination directory

- Integration Manager host

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a physical host  
*Shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

### Description

This file defines metric of SQL exporter to be displayed on the **Trend** tab, **Dashboard** tab, and **Dashboard List** dialog box of Integrated Operation Viewer window.

Defined content is used for the `__metricListGet` method of product plugin in JP1/IM - Agent and the return value of the `__timeSeriesDataGet` method.

If JP1/IM - Manager is in a hierarchical configuration and you want the Integration Manager to refer to trend data stored in Trend data Management Database of lower manager, you must add the referenced trend data metrics to the Integration Manager metric definition file.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## Time of import of definitions

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Description

See *Description* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## Model file settings (default)

The following table shows the settings (initial status) of metric described in SQL exporter's metric definition file model file.

- `connections`<sup>#</sup>
  - Setting contents (default)

#

Equivalent to Cache Hit % field in JP1/PFM-RM for Microsoft SQL Server PI\_SERV record.

## ◆ SQL exporter default collection metric definition file (mssql\_standard.collector.yml)

### Format

Write in YAML format.

See GitHub website for the format of this file.

### File

mssql\_standard.collector.yml

mssql\_standard.collector.yml.model (model file)

### Storage destination directory

- Integrated agent host (model files only)

- For a physical host

*to-which-Windows-version-of-SQL-exporter-archivefile#-will-be-extracted* \sql\jp1ima\conf

#

*Agent-path\options\sql\_exporter\_windows\_VVRRSS.zip*

### Description

Files that define metric that SQL exporter retrieves.

This file cannot be edited.

### Character code

UTF-8 (without BOM)

### Line feed code

CR+LF

### Time of import of definitions

This is applied when SQL exporter is started or restarted.

## Description

See GitHub website for the format of this file.

## ◆ Container monitoring metric definition file (metrics\_kubernetes.conf)

### Syntax

```
[
  {
    "name": "metric-name-of-trend-data",
    "default": default-selection-status,
    "promql": "PromQL-statement",
    "resource_en": {
      "category": "metric-category-in-English",
      "label": "metric-label-in-English",
      "description": "metric-description-in-English",
      "unit": "metric-unit-in-English"
    },
    "resource_ja": {
      "category": "metric-category-in-Japanese",
      "label": "metric-label-in-Japanese",
      "description": "metric-description-in-Japanese",
      "unit": "metric-unit-in-Japanese"
    },
    "module": "component-name"
  }, ...
] #
```

#

The number of elements that can be written inside the brackets ([]) is from 1 to 1,000. A KAJY24609-E error message is output when writing a number of elements that falls outside this range.

## File

metrics\_kubernetes.conf

metrics\_kubernetes.conf.model (model file)

## Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\_kubernetes\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\_kubernetes\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs\_kubernetes/

When using a logical host

*shared-directory/jplimm/conf/imdd/plugin/jplpccs\_kubernetes/*

## Description

This file defines the metric information of the container monitoring displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definitions are used for the return values of the `__metricListGet` method and `__timeSeriesDataGet` method for JP1/IM - Agent product plug-ins. If JP1/IM - Manager is in a hierarchical configuration and trend data stored in the database of a lower-level manager is referenced from an upper-level manager, you must add the metrics of the referenced trend data to the metrics definition file of the upper-level manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

For details, see *Content description* in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#) (2. Definition Files) for JP1/IM - Agent. However, the `module` member is required and the component type is specified. The value specified here is used as the object root type.

## Settings in the model file (initial status)

The following shows the settings (initial status) of each metric written in the container monitoring metric definition file (model file).

- `kube_job_status_failed`
  - Settings (initial status)

## ◆ Any Prometheus trend name metric definition file (metrics\_any-Prometheus-trend-name.conf)

### Format

See the *Format* section in *Node exporter metric definition file (metrics\_node\_exporter.conf)*.

### File

metrics\_any-Prometheus-trend-name.conf

The *any-Prometheus-trend-name* should be a Value that Setup the `jp1_pc_trendname` of the discovery configuration file or Prometheus configuration file.

### Storage directory

#### ■ Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jp1pccs\
- For a logical host  
*shared-folder*\jp1imm\conf\imdd\plugin\jp1pccs\

In Linux:

- For a physical host  
*/etc/opt/jp1imm/conf/imdd/plugin/jp1pccs/*
- For a logical host  
*shared-directory/jp1imm/conf/imdd/plugin/jp1pccs/*

### Description

This file defines the metric information displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Defined content is used for the `__metricListGet` method of product plugin in JP1/IM - Agent and the return Value of the `__timeSeriesDataGet` method.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition file of Integrated manager.

### Character code

UTF-8 (without BOM)

### Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See the *Information that is specified* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

## ◆ User-specific metric definition file (metrics\_any-Prometheus-trend-name.conf)

### Format

See the *Format* section in [Node exporter metric definition file \(metrics\\_node\\_exporter.conf\)](#).

### File

`metrics_any-Prometheus-trend-name.conf`

Set *any-Prometheus-trend-name* to the value that is setup to the `jp1_pc_trendname` of the user-specific discovery configuration file.

### Storage directory

#### ■ Integrated manager host

In Windows:

- For a physical host  
`Manager-path\conf\imdd\plugin\jp1pccs\user\`
- For a logical host  
`shared-folder\jp1imm\conf\imdd\plugin\jp1pccs\user\`

In Linux:

- For a physical host  
`/etc/opt/jp1imm/conf/imdd/plugin/jp1pccs/user/`
- For a logical host  
`shared-directory/jp1imm/conf/imdd/plugin/jp1pccs/user/`

### Description

This file defines the user-specific metric information displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definition uses a return value of `__metricListGet` method and `__timeSeriesDataGet` method in the product plug-in of JP1/IM - Agent.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition File of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Information that is specified

See the *Information that is specified* section in *Node exporter metric definition file (metrics\_node\_exporter.conf)*.

## ◆ User-specific metric definition file (Promitor) (metrics\_any-Prometheus-trend-name.conf)

### Syntax

See the *Format* section in *Node exporter metric definition file (metrics\_node\_exporter.conf)*.

### File

metrics\_any-Prometheus-trend-name.conf

Set *any-Prometheus-trend-name* to the value that is setup to the jpl\_pc\_trendname of the user-specific discovery configuration file.

## Storage directory

### ■ Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\_azure\user\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\_azure\user\

In Linux:

- For a physical host  
/etc/opt/jplimm/conf/imdd/plugin/jplpccs\_azure/user/
- For a logical host  
*shared-directory*/jplimm/conf/imdd/plugin/jplpccs\_azure/user/

## Description

This file defines the user-specific metric information displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definition uses a return value of `__metricListGet` method and `__timeSeriesDataGet` method in the product plug-in of JP1/IM - Agent.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition File of Integrated manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See the *Information that is specified* section in *Node exporter metric definition file (metrics\_node\_exporter.conf)*.

## ◆ User-specific metric definition file (container monitoring) (metrics\_any-Prometheus-trend-name.conf)

### Syntax

See the *Format* section in *Container monitoring metric definition file (metrics\_kubernetes.conf)*.

### File

`metrics_any-Prometheus-trend-name.conf`

Set *any-Prometheus-trend-name* to the value that is setup to the `jp1_pc_trendname` of the user-specific discovery configuration file.

## Storage directory

### ■ Integrated manager host

In Windows:

- For a physical host  
`Manager-path\conf\imdd\plugin\jp1pccs_kubernetes\user\`
- For a logical host

`shared-folder\jplimm\conf\imdd\plugin\jplpccs_kubernetes\user\`

In Linux:

- For a physical host  
`/etc/opt/jplimm/conf/imdd/plugin/jplpccs_kubernetes/user/`
- For a logical host  
`shared-directory/jplimm/conf/imdd/plugin/jplpccs_kubernetes/user/`

## Description

This file defines the user-specific metric information displayed on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window.

Definition uses a return value of `__metricListGet` method and `__timeSeriesDataGet` method in the product plug-in of JP1/IM - Agent.

If JP1/IM - Manager is in a hierarchical configuration and you want to refer to trend data stored in Trend data Management Database of lower manager from Integrated manager, you must add trend data metrics that you want to refer to metric definition File of Integrated manager.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows; CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected when the metric information is obtained on the **Trends** tab, **Dashboard** tab, and **Dashboard List** dialog box of the Integrated Operation Viewer window, or with the REST API.

## Content description

See the *Information that is specified* section in [Container monitoring metric definition file \(metrics\\_kubernetes.conf\)](#).

## ◆ AWS definition file (aws\_settings.conf)

### Format

```
{
  "yace_account_mapping": {
    "AWS Account ID": "AWS account string",
    ...
  }
}
```

## File

`aws_settings.conf`

`aws_settings.conf.model` (model file)

## Storage directory

### ■Integrated manager host

In Windows:

- For a physical host  
*Manager-path*\conf\imdd\plugin\jplpccs\
- For a logical host  
*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\

In Linux:

- For a physical host  
*/etc/opt/jplimm/conf/imdd/plugin/jplpccs/*
- For a logical host  
*shared-directory/jplimm/conf/imdd/plugin/jplpccs/*

## Description

Configuration files for AWS and Yet another cloudwatch exporter.

Set it when monitoring using the Yet another cloudwatch exporter in the monitoring module (Cloud).

`yace_account_mapping` specifies the mapping between the AWS account ID used by Yet another cloudwatch exporter and the account string to be set in the IM management node properties and extended attribute values of the JP1 event. If there is no corresponding definition for the account ID specified in Yet another cloudwatch exporter, the IM management node properties of the Yet another cloudwatch exporter and the account in the extended attribute value of the JP1 event are set to "default".

If JP1/IM - Manager is in a hierarchical configuration and lower manager manages Yet another cloudwatch exporter, you must specify the mapping of AWS account ID of Yet another cloudwatch exporter managed by lower manager and the account string set in properties of IM managed node or JP1 event extension to AWS definition file of Integrated manager.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the `jddcreatetree` and `jddupdatetree` commands are executed, they are reflected in the tree display contents of the Integrated Operations Viewer. Or, an alert that monitors Yet another cloudwatch exporter's performance data reflects when the JP1 event is issued.

## Information that is specified

### *AWS Account ID*

Specify the AWS account ID to be used in the settings for connecting to CloudWatch from Yet another cloudwatch exporter, using characters other than 1 to 255 control characters.

For CloudWatch connection Setup, see *2.19.2(8)(b) Modify Setup to connect to CloudWatch (for Linux) (optional)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

### *AWS account string*

Specify the SID of Yet another cloudwatch exporter and the account string to be set for the account in the properties of the IM management node in characters other than 1 to 255 control characters.

## 2.11 JP1/IM - Manager definition files (JP1/IM agent management base)

---

### ◆ imbase common configuration file (jpc\_imbasecommon.json)

#### Format

#### File

jpc\_imbasecommon.json

jpc\_imbasecommon.json.model (model file)

#### Storage directory

##### ■ Integrated manager host

In Windows:

*Manager-path*\conf\imdd\imagent\

In Linux:

/etc/opt/jplimm/conf/imdd/imagent/

#### Description

This configuration file defines common operation of JP1/IM agent management base.

#### Character code

UTF-8 (without BOM)

#### Line feed code

In Windows: CR+LF

In Linux: LF

#### When the definitions are applied

Reflects when imbase and imbaseproxy services are Restart.

## Information that is specified

| Member name |                    | Optional     | Format | Value to Setup                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Notes

- If this File is not accessible under Physical host, the default Value is applied when all items are omitted.
- If this File cannot be accessed under Logical host, imbase and imbaseproxy will be stopped abnormally.

- If JSON format is invalid or specification does not match the type , imbase or imbaseproxy is stopped abnormally.

## ◆ imbase configuration file (jpc\_imbase.json)

### Format

```
{
  "port": Listen port,
  "file_operation_timeout": "Timeout for File manipulation"
  "log": {
    "message": {
      "num": Logging sectors
      "size": Max. file size
    },
    "internal": {
      "level": "Logging Level"
      "num": Logging sectors
      "size": Max. file size
    },
    "access": {
      "num": Logging sectors
      "size": Max. file size
    }
  },
  "action": {
    "startup_action_check_timeout": Timeout period to transition actions that remain in progress when the Unified Agent Management Platform is started to the terminal state
  },
  "//jplbase_forward_send": {
    "port": "jplimevt"
  },
  "polling_monitoring_interval": Monitoring interval for Polling Monitoring function,
  "agent_polling_interval": Connection interval for JPl/IM agent control base
}
```

### File

jpc\_imbase.json

jpc\_imbase.json.model (model file)

### Storage directory

#### ■ Integrated manager host

In Windows:

*Manager-path*\conf\imdd\imagent\

In Linux:

/etc/opt/jplimm/conf/imdd/imagent/

## Description

This configuration file defines the operation of imbase process in JP1/IM agent management base.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

This information is reflected in imbase operation when imbase service is Restart.

## Information that is specified

| Member name            |          |       | Optional | Format | Value to Setup                                                                                                                                                                                                                                                  |

## Notes

- If this File is not accessible under Physical host, the default Value is applied when all items are omitted.
- If this File cannot be accessed under Logical host, imbase and imbaseproxy will be stopped abnormally.
- If JSON format is invalid or the type Does not match the type specified, imbase and imbaseproxy is stopped abnormally.

File

jpc\_imbaseproxy.json

jpc\_imbaseproxy.json.model (model file)

Storage directory

- Integrated manager host
  - In Windows:  
*Manager-path*\conf\imdd\imagent\  
In Linux:  
/etc/opt/jplimm/conf/imdd/imagent/

Description

This configuration file defines the operation of imbaseproxy process in JP1/IM agent management base.

Character code

UTF-8 (without BOM)

Line feed code

In Windows: CR+LF

In Linux: LF

When the definitions are applied

Reflected when imbaseproxy serviceis Restart.

## Notes

- If this File is not accessible under Physical host, the default Value is applied when all items are omitted.
- If this File cannot be accessed under Logical host, imbase or imbaseproxy will be stopped abnormally.
- If JSON format is invalid or does not match the type specified, imbase or imbaseproxy is stopped abnormally.

## 2.12 JP1/IM - View definition files

---

### ◆ Operation definition file of the IM Configuration Management - View (jcfview.conf)

#### Format

```
jcfview.login.host.max=maximum-number-of-recorded-hosts
jcfview.login.user.max={0|1}
jcfview.screen.history.enable={0|1}
jcfview.response.wait.time=server-response-wait-timeout-period
jcfview.imconfigreflect.response.wait.time=response-wait-timeout-period-for-reflection-of-system hierarchy
jcfview.screen.title.logininfo.enable={0|1}
```

#### File

jcfview.conf (operation definition file for IM Configuration Management - View)

jcfview.conf.model (model file for the operation definition file for IM Configuration Management - View)

#### Storage directory

*View-path*\conf\jcfview\

#### Description

This file specifies the operation of IM Configuration Management - View.

#### When the definitions are applied

The definition takes effect when IM Configuration Management - View starts.

#### Information that is specified

jcfview.login.host.max=*maximum-number-of-recorded-hosts*

Specifies as a decimal value the maximum number of hosts that have logged in successfully. Permitted values are from 0 to 20. The default is 5.

jcfview.login.user.max={0|1}

Specifies whether to display the name of the JP1 user who logged in previously in the **User name** text box of the Login window. If 1 is specified, the name of the user who logged in previously is displayed. If 0 is specified, the name of the user is hidden. If you omit this parameter, or if you specify a value other than 0 or 1, 1 is assumed. The default is 1.

jcfview.screen.history.enable={0|1}

Specifies whether the function that inherits the display position and size of the IM Configuration Management - View window, as well as the selection status of the displayed buttons that were in use the last time the screen was open, is to be used. This setting applies to the IM Configuration Management window, the Edit Agent Configuration window, the Edit Remote Monitoring Configuration window, and the Display/Edit Profiles window.

The permitted values are as follows:

- 0: Do not use the window display settings history function.

- 1: Use the window display settings history function (default value).

Note that if you specify 0 and then start JP1/IM - View, all the window display settings history files will be deleted.

`jcfview.response.wait.time=server-response-wait-timeout-period`

Specifies in decimal notation the timeout period for waiting for a response when applying the hierarchy configuration (IM configuration) to the system.

The permitted value range is from 60,000 to 3,600,000; the default is 1,800,000. If the specified value is less than the minimum value, greater than the maximum value, invalid, or undefined, the default value is used.

When a timeout occurs, the KNAN20105-E message is displayed. If the KNAN20105-E message is issued frequently, we recommend that you revise the timeout setting.

`jcfview.imconfigreflect.response.wait.time=response-wait-timeout-period-for-updating-system-hierarchy`

Specifies in milliseconds in decimal notation the timeout period for waiting for the system hierarchy to be applied. The permitted value range is from 60,000 to 36,000,000; the default is 18,000,000. If the specified value is less than the minimum value, greater than the maximum value, invalid, or undefined, the default value is used.

When a timeout occurs, the KNAN20105-E message is displayed. If the KNAN20105-E message is issued frequently, revise the timeout setting.

`jcfview.screen.title.logininfo.enable={0|1}`

You can prevent the name of the logged-in JP1 user from being displayed in the title of the IM Configuration Management window, the Edit Agent Configuration window, the Edit Remote Monitoring Configuration window, and the Display/Edit Profiles window. When 1 is specified, the name of the logged in JP1 user is displayed. When 0 is specified, the name of the user is hidden. If you omit this parameter, or if you specify a value other than 0 or 1, 1 is assumed. The default is 1.

## Example definition

```
jcfview.login.host.max=5
jcfview.login.user.max=1
jcfview.screen.history.enable=1
jcfview.response.wait.time=1800000
jcfview.imconfigreflect.response.wait.time=18000000
```

`jcfview.screen.title.logininfo.enable=1`

## ◆ Communication environment definition file (view.conf.update)

### Format

```
[JP1_DEFAULT\JP1CONSOLEVIEW]
"COM_SO_TIMEOUT"=dword:hexadecimal-value
"COM_RMI_TIMEOUT"=dword:hexadecimal-value
```

### File

`view.conf.update` (model file for the communication environment definition file)

### Storage directory

*View-path*\default\

## Description

This file defines timeout periods for communication between JP1/IM - View and JP1/IM - Manager (Central Console).

When a low-speed line is used in the network or when the viewer's workload is high, timeouts might occur during the viewer's communication processing, resulting in communication errors. You can prevent such communication errors by modifying timeout periods. If you set a timeout period, you must also specify the same setting at the JP1/IM - Manager (Central Console) that is connected.

If you change any value in this definition file, you must also change the value in the communication environment definition file for JP1/IM - Manager (Central Console).

The required definition is provided as a model file. To change the settings, copy the model file and then edit the copy.

## When the definitions are applied

The definitions take effect after the `jbssetcnf` command is executed and JP1/IM - View is restarted.

## Information that is specified

[JP1\_DEFAULT\JP1CONSOLEVIEW]

Specifies the key name for the JP1/IM - View environment settings.

In JP1/IM - View, this parameter is fixed.

"COM\_SO\_TIMEOUT"=dword:*hexadecimal-value*

Specify in milliseconds as a hexadecimal value the amount of time to wait for the arrival of reception data (socket timeout value). The default value is `dword:0000EA60` (60,000 milliseconds).

In an environment in which a low-speed line is used or event traffic is heavy, specify a larger value.

The range of values that can be specified is `0x00000001` to `0x0036EE80` (3,600,000 milliseconds).

The specified value must not exceed the value specified for `COM_RMI_TIMEOUT` (default: `0000EA60`) in the `view.conf.update` communication environment definition file.

"COM\_RMI\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the timeout period for communication processing during the following operations or settings:

- Login
- Logout
- Manual and automatic refreshing of the Event Console window
- Changing the event action status
- Deletion of server events
- Event search
- User environment setting
- Severe event setting
- Automated action setting
- Filter setting
- Command execution
- Function status notification recovery operation
- Response to a response-waiting event and release from the hold-and-accumulate state

The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0000EA60 (60,000 milliseconds).

## Example

```
[JP1_DEFAULT\JP1CONSOLEVIEW]
"COM_SO_TIMEOUT"=dword:000009C4
"COM_RMI_TIMEOUT"=dword:0000EA60
```

## ◆ Communication environment definition file (tree\_view.conf.update)

### Format

```
[JP1_DEFAULT\JP1CONSOLEVIEW]
"SOV_LOGIN_TIMEOUT"=dword:hexadecimal-value
"SOV_GETTREE_TIMEOUT"=dword:hexadecimal-value
"SOV_SETTREE_TIMEOUT"=dword:hexadecimal-value
"SOV_MAKETREE_TIMEOUT"=dword:hexadecimal-value
"SOV_GETMAP_TIMEOUT"=dword:hexadecimal-value
"SOV_SETMAP_TIMEOUT"=dword:hexadecimal-value
"SOV_GETPROFILE_TIMEOUT"=dword:hexadecimal-value
"SOV_SETPROFILE_TIMEOUT"=dword:hexadecimal-value
"SOV_DEF_TIMEOUT"=dword:hexadecimal-value
```

### File

tree\_view.conf.update (model file for the communication environment definition file)

### Storage directory

View-path\default\

### Description

This file defines timeout periods for communication between JP1/IM - View and JP1/IM - Manager (Central Scope).

When a low-speed line is used in the network or when the viewer's workload is high, timeouts might occur during the viewer's communication processing, resulting in communication errors. You can prevent such communication errors by modifying timeout periods.

The required definition is provided as a model file. To change the settings, copy the model file and then edit the copy.

### When the definitions are applied

The definition takes effect after the jbssetcnf command is executed and JP1/IM - View is restarted.

### Information that is specified

```
[JP1_DEFAULT\JP1CONSOLEVIEW]
    Specifies the key name for the JP1/IM - View environment settings.
    In JP1/IM - View, this parameter is fixed.
```

"SOV\_LOGIN\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for login and logout processing. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0002BF20 (180,000 milliseconds).

"SOV\_GETTREE\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for acquisition of the status of monitoring objects, updating of the monitoring tree, and performance of display processing for the Monitoring Tree (Editing) window. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0036EE80 (3,600,000 milliseconds).

"SOV\_SETTREE\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for changing of the status of monitoring objects, setting of monitoring targets, and performance of tree update processing. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0036EE80 (3,600,000 milliseconds).

"SOV\_MAKETREE\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for performance of automatic generation of the monitoring tree. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0036EE80 (3,600,000 milliseconds).

"SOV\_GETMAP\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for performance of display processing for the visual monitoring list and for the Visual Monitoring window. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0002BF20 (180,000 milliseconds).

"SOV\_SETMAP\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for creation, deletion, and copying of visual monitoring maps, and for performance of visual monitoring update processing. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0002BF20 (180,000 milliseconds).

"SOV\_GETPROFILE\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for acquisition of user environment settings and system environment settings for the Monitoring Tree window. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0002BF20 (180,000 milliseconds).

"SOV\_SETPROFILE\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for performance of reflection processing of user environment settings and system environment settings for the Monitoring Tree window. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:0002BF20 (180,000 milliseconds).

"SOV\_DEF\_TIMEOUT"=dword:*hexadecimal-value*

Specifies in milliseconds as a hexadecimal value the server response wait time for acquisition and setting of monitoring object properties, acquisition of a list of login users, and acquisition of automatically generated configuration selections. The permitted value range is from 0000EA60 to 0036EE80 (from 60,000 to 3,600,000 milliseconds), and the default is dword:001B7740 (1,800,000 milliseconds).

## Example definition

```
[JP1_DEFAULT\JP1CONSOLEVIEW]
"SOV_LOGIN_TIMEOUT"=dword:0002BF20
"SOV_GETTREE_TIMEOUT"=dword:0002BF20
"SOV_SETTREE_TIMEOUT"=dword:0002BF20
"SOV_MAKETREE_TIMEOUT"=dword:0036EE80
"SOV_GETMAP_TIMEOUT"=dword:0002BF20
"SOV_SETMAP_TIMEOUT"=dword:0002BF20
"SOV_GETPROFILE_TIMEOUT"=dword:0002BF20
"SOV_SETPROFILE_TIMEOUT"=dword:0002BF20
"SOV_DEF_TIMEOUT"=dword:0002BF20
```

## ◆ Non-encryption communication host configuration file (nosslhost.conf)

### Format

```
[NO_SSL_HOST]
manager-host-name
manager-host-name
    :
manager-host-name
```

### File

nosslhost.conf (non-encryption communication host configuration file)

nosslhost.conf.model (model file for the non-encryption communication host configuration file)

### Storage directory

*View-path*\conf\ssl

### Description

This file is for configuring which hosts are to use non-encrypted communication. By default, this file specifies non-encrypted communication for all hosts, so if you want to use encrypted communication, you must configure this file. If you want JP1/IM - View to use non-encrypted communications upon login to a manager host, you must define the host in this file. Communication with manager hosts that are not defined in this file will be encrypted.

JP1/IM - View compares the destination host name in the Login window and the connection target host name specified in the `-h` option of the `jcoview` or `jcfview` command against the manager host names listed in the definition file, and if there is a match, uses non-encrypted communication with the host. The host names are not case sensitive.

### When the definitions are applied

The settings for the non-encryption communication host configuration file take effect at the following times:

- When you log in to Central Console from the Central Console viewer, log in to Central Scope from the Central Scope viewer, or log in to IM Configuration Management from the IM Configuration Management viewer (when you display the Login window and click the **OK** button to log in)

- When you display the Central Console viewer or Central Scope viewer from the IM Configuration Management viewer
- When you display the site manager's IM Configuration Management viewer from the IM Configuration Management viewer (Launch Base View)

The following table shows whether the non-encryption communication host configuration file is read when different viewers are launched

**Table 2–95: Whether the non-encryption communication host configuration file is read when different viewers are launched**

| Calling window (operation in calling window)                                                                      | Check box       |               | Viewer to be launched                      | Definition file is read |
|-------------------------------------------------------------------------------------------------------------------|-----------------|---------------|--------------------------------------------|-------------------------|
|                                                                                                                   | Central Console | Central Scope |                                            |                         |
| Login window of the Central Console viewer or Central Scope viewer (click <b>OK</b> button)                       | C               | U             | Central Console                            | Y                       |
|                                                                                                                   | U               | C             | Central Scope                              | Y                       |
|                                                                                                                   | C               | C             | Central Console and Central Scope          | Y <sup>#</sup>          |
| Login window of the IM Configuration Management viewer (click <b>OK</b> button)                                   |                 |               | IM Configuration Management                | Y                       |
| Login window of the Central Scope viewer (click <b>OK</b> button)<br>Launch from Monitoring Tree (Editing) window |                 |               | Central Scope                              | Y                       |
| Central Console viewer (Main menu or toolbar)                                                                     |                 |               | Central Scope                              | N                       |
| Central Scope viewer (Main menu or toolbar)                                                                       |                 |               | Central Console                            | N                       |
| IM Configuration Management viewer (Main menu or toolbar)                                                         |                 |               | Central Console                            | Y                       |
|                                                                                                                   |                 |               | Central Scope                              | Y                       |
| IM Configuration Management viewer (Launch Base View)                                                             |                 |               | Site manager's IM Configuration Management | Y                       |

Legend:

- Y: The definition file is read.
- N: The definition file is not read.
- C: The check box is selected.
- U: The check box is not selected.

#

Although two viewers (the Central Console viewer and Central Scope viewer) are launched, the definition file is only read once.

## Information that is specified

[NO\_SSL\_HOST]

This block is mandatory. Uppercase and lowercase are distinguished. Any space or tab character immediately preceding or following [NO\_SSL\_HOST] will be ignored.

*manager-host-name*

Specify the host name or IPv4 address of a destination manager host for which non-encrypted communication is to be used. You can also specify *manager-host-name* in FQDN format. By default, an asterisk (\*) is set. The wildcard asterisk (\*) indicates that non-encrypted communication is to be used for connections to all manager hosts. A maximum of 1,024 hosts can be listed. You cannot list the same manager host name more than once. Letter case is ignored. Specify between 0 and 255 characters. Any space or tab character immediately preceding or following *manager-host-name* will be ignored.

## Example definition

Example definition 1: Use non-encrypted communication to communicate with all manager hosts

```
[NO_SSL_HOST]
*
```

Specifying an asterisk (\*) indicates that non-encrypted communication is to be used with all manager hosts. When an asterisk (\*) is specified, an error results if anything other than the above is specified.

Example definition 2: Use encrypted communication to communicate with all manager hosts

```
[NO_SSL_HOST]
```

To use encrypted communication to communicate with all manager hosts, delete the asterisk (\*).

Example definition 3: Use a mixture of non-encrypted and encrypted communication to communicate with manager hosts

```
[NO_SSL_HOST]
hostA
hostB
```

Communication with the manager hosts `hostA` and `hostB` will be non-encrypted, while communication with other manager hosts will be encrypted.

## ◆ IM-View settings file (tuning.conf)

### Format

```
LOGIN_HISTORY_MAX=number-of-connected-host-log-entries
MENU_AUTO_START={ON | OFF}
ACTIONLIST_AUTO_START={ON | OFF}
WWW_BROWSER_PATH=start-path-of-browser
CLIPBOARD_OUTPUT={ON | OFF}
LOGIN_USER_HISTORY_MAX={0 | 1}
SCREEN_TITLE_LOGININFO={ON | OFF}
```

### File

`tuning.conf` (IM-View settings file)

`tuning.conf.model` (model file for the IM-View settings file)

### Storage directory

`View-path\conf\`

### Description

This file defines the operation of JP1/IM - View, such as the number of connected-host log entries in the Login window, the operation when the Event Console window is displayed, and whether data can be copied to the clipboard.

Specify each item in the `tuning.conf` file in the format *parameter-name=value*. The following lines are ignored in the definition file:

- A line consisting only of spaces
- A line beginning with a hash mark (#) or a hash mark preceded by any number of spaces (comment line)

## When the definitions are applied

The definition takes effect after JP1/IM - View is restarted.

## Information that is specified

`LOGIN_HISTORY_MAX=number-of-connected-host-log-entries`

Specifies the number of entries (hosts to which connection has been made) that are to be displayed in the **Host to connect** list box in the login window.

The permitted value range is from 0 to 20. If 0 is specified, no history of connected hosts is displayed. If this parameter is omitted, 5 is assumed. The default is 5.

`MENU_AUTO_START={ON | OFF}`

Specifies whether the Tool Launcher is to be started when the Event Console window is displayed. If you specify ON, the Tool Launcher window is opened when the Event Console window is displayed. If you specify OFF, the Tool Launcher window is not opened when the Event Console window is displayed. If this parameter is omitted, OFF is assumed. The default is OFF.

`ACTIONLIST_AUTO_START={ON | OFF}`

Specifies whether the List of Action Results window is to be displayed when the Event Console window is displayed. If you specify ON, the List of Action Results window is opened when the Event Console window is displayed. If you specify OFF, the List of Action Results window is not opened when the Event Console window is displayed. If this parameter is omitted, OFF is assumed. The default is OFF.

`WWW_BROWSER_PATH=start-path-of-browser`

Specifies the start path of the Web browser that is to be used to open the Tool Launcher and monitor windows. The default is that this parameter is not specified. If you specify this parameter, you must add a parameter in the definition file.

When you specify a path, express \ as \\. Do not enclose the start path name in double-quotation marks ("). Make sure that the specified Web browser is supported by the Tool Launcher and the application that is started when monitor windows are opened.

If this parameter is omitted, the Web browser associated with files of the .html file type on the host is used. Specify this parameter in order to use a Web browser that is not associated with files of the .html file type (including a different version of the same Web browser).

`CLIPBOARD_OUTPUT={ON | OFF}`

Specifies whether the function for copying JP1 event information, action results, and command execution results to the clipboard is to be enabled.

Specifying ON enables the function for copying to the clipboard. When it is enabled, you use this function by selecting the information in the JP1/IM - View window that you want to copy, and then pressing the **Ctrl** and **C** keys to copy it in CSV format to the clipboard. In the Event Console window, **Copy** is displayed in the **Edit** menu.

Specifying OFF disables the function for copying to the clipboard.

If this parameter is omitted, ON is assumed.

`LOGIN_USER_HISTORY_MAX={0 | 1}`

Specifies whether to display the names of JP1 users who have logged in previously in the **User name** text box of the Login window. When 1 is specified, the names of users who logged in previously are displayed. When 0 is specified, the names are hidden. If you omit this parameter, or if you specify a value other than 0 or 1, 1 is assumed. The default is 1.

SCREEN\_TITLE\_LOGININFO={ON | OFF}

You can prevent the name of the logged-in JP1 user from being displayed in the title of the Monitoring Tree window, the Monitoring Tree (Editing) window, the Visual Monitoring (Editing) window, the Event Console window, the Execute Command window, and the List of Action Results window. The ON specification displays the name of the logged-in JP1 user. The OFF specification hides name of the logged-in JP1 user. The default is ON. If you omit this parameter, or if you specify a value other than ON or OFF, ON is assumed. The value is case sensitive.

## Example definition

```
# *****
# * JP1/Integrated Management - View Tuning definition file *
# *****

# Input history maximum number in connected hostname input field on log in s
screen
LOGIN_HISTORY_MAX=5
# Tool Launcher is automatically started at log in whether (ON) (OFF).
MENU_AUTO_START=OFF
# List of Action Result is automatically started at log in whether (ON) (OFF
).
ACTIONLIST_AUTO_START=OFFCLIPBOARD_OUTPUT=ON
# Copies JP1 event information, action results, and command execution result
s to the clipboard (ON) (OFF).
CLIPBOARD_OUTPUT=ON
# Displays the names of previously logged-in users in the Login window (1) (
0).
LOGIN_USER_HISTORY_MAX=1
# Displays the user name in the window title bar (ON) (OFF).
SCREEN_TITLE_LOGININFO=ON
```

## ◆ Web page call definition file (hitachi\_jp1\_product-name.html)

### Format

```
<HTML>
<HEAD>
<META HTTP-EQUIV="refresh" CONTENT="0;URL=URL-of-other-product's-web-page">
</HEAD>
</HTML>
```

### File

hitachi\_jp1\_product-name.html (Web page call definition file)

hitachi\_jp1\_product-name.html.model (model file for the Web page call definition file)

### Storage directory

View-path\conf\webdata\en\

### Description

This file is used for calling another product's Web page from the Tool Launcher.

When another product's Web page is to be called from the Tool Launcher, the Web page call definition file is referenced first and then its URL defined in this file is accessed. If you plan to call some other product's web page from the Tool Launcher, you must set its URL by editing this file as appropriate to your environment.

If you attempt to display a Web page from the Tool Launcher without having set its URL, a page describing the setting method is displayed.

#### *List of Web page call definition files*

JP1/IM provides the definition files listed in the table below. See the individual linked product documentation for details about the versions and operating systems that support the linked product.

**Table 2–96: List of Web page call definition files that correspond to item names in the Tool Launcher window**

| Item in the Tool Launcher window    |                         |                                                  | Web page call definition file name                | Product name                                   |
|-------------------------------------|-------------------------|--------------------------------------------------|---------------------------------------------------|------------------------------------------------|

#  
JP1/IM - View for Windows cannot link with the Web page versions of JP1/Software Distribution Manager.  
By changing the URLs specified in these HTML files to the URLs of individual product Web pages, you can access those products' Web pages from the Tool Launcher window.

## When the definitions are applied

The definition takes effect when JP1/IM - View is restarted.

## Information that is specified

```
<META HTTP-EQUIV="refresh" CONTENT="0;URL=URL-of-other-product's-web-page">
```

Specifies the URL of another product's Web page.

If you attempt to display another product's Web page from the Tool Launcher without setting its URL, a page describing the setting method is displayed (*View-path\conf\webdata\en\webconfig\_hitachi\_jp1\_product-name.html*). You can specify the URL by following the instructions provided on the displayed page.<sup>#</sup>

- #
- The URL set on this page is the default value. With some products, the user can customize the URL. Check the URLs used by other products beforehand.  
Sometimes, the URL of a product will have changed, for a reason such as upgrading. If no window opens at the specified URL, check the applicable product's documentation.
  - In *host name*, specify the host name or IP address of the machine where the product corresponding to the Web page is installed.

## Example definition

```
<HTML>  
<HEAD>  
<META HTTP-EQUIV="refresh" CONTENT="0;URL=http://hostA/OvCgi/ovlaunch.exe">  
</HEAD>  
</HTML>
```

## ◆ Start program definition file (!JP1\_CS\_APP0.conf)

### Format

```
@define-block type="application-execution-def";  
id="program-identifier";  
path="start-program-path";  
@define-block-end;
```

### File

!JP1\_CS\_APP0.conf (start program definition file)

!JP1\_CS\_APP0.conf.model (model file for the start program definition file)

## Storage directory

*View-path*\conf\sovtoolexec\en\

## Description

This file defines the start path for a program that is added to the toolbar in the Monitoring Tree window.

To add a program to the toolbar in the Monitoring Tree window, and then start the program from the toolbar, you must also edit the following definition files:

- Toolbar definition file
- Icon operation definition file

## When the definitions are applied

The definition takes effect when the Monitoring Tree window is re-opened.

## Information that is specified

From @define-block type to @define-block-end;

The information from @define-block type to @define-block-end; constitutes a single definition block. To add multiple programs to the toolbar in the Monitoring Tree window, specify this definition block as many times as there are programs to be added. You can specify the following parameters in this definition block:

`id="program-identifier"`

Specifies the identifier that indicates the program to be started. You can specify from 1 to 32 alphanumeric characters. This character string must be unique within the definition file. The program identifier specified in this parameter must be the same as a program identifier that is specified in the icon operation definition file (!JP1\_CS\_FTREE0.conf). For details about the icon operation definition file (!JP1\_CS\_FTREE0.conf), see *Icon operation definition file (!JP1\_CS\_FTREE0.conf)* in Chapter 2. Definition Files.

`path="start-program-path"`

Specifies the path of the program to be started. An executable file that can be specified must be an .exe or .bat file.

## Example definition

```
#
# All Rights Reserved. Copyright (C) 2003, Hitachi, Ltd.
#
@file type="application-execution-definition", version="0300";
#-----
@define-block type="application-execution-def";
id="app_notepad";
path="C:\WINNT\NOTEPAD.EXE";
@define-block-end;
#-----
```

## ◆ Toolbar definition file (!JP1\_CS\_FTOOL0.conf)

### Format

```
@define-block type="function-toolbar-def";
toolbar="sov_JP1_IM_Central_Console|sov_JP1_IM_Function_Tree|sov_JP1_IM_Visual_View|sov_JP1_IM_Bmv_Help|icon-identifier...";
@define-block-end;
```

### File

!JP1\_CS\_FTOOL0.conf (toolbar definition file)

!JP1\_CS\_FTOOL0.conf.model (model file for the toolbar definition file)

### Storage directory

*View-path*\conf\sovtoolitem\en\

### Description

This file defines the order of programs that are added to the toolbar in the Monitoring Tree window.

To add a program to the toolbar in the Monitoring Tree window, and then start the program from the toolbar, you must also edit the following definition files:

- Start program definition file
- Icon operation definition file

### When the definitions are applied

The definition takes effect when the Monitoring Tree window is re-opened.

### Information that is specified

From @define-block type to @define-block-end;

The information from @define-block type to @define-block-end; constitutes a single definition block. This block can be specified only once in the definition file.

```
toolbar="sov_JP1_IM_Central_Console|sov_JP1_IM_Function_Tree|
sov_JP1_IM_Visual_View|sov_JP1_IM_Bmv_Help|icon-identifier";
```

Specifies the icon identifiers in the order they are to be displayed. The icon identifiers are separated by the vertical bar (|) and the icons are displayed from left to right in the Monitoring Tree window in the order they are specified here. An icon identifier is a character string consisting of no more than 32 alphanumeric characters. Each icon identifier character string must be unique within the definition file. The icon identifiers specified in this parameter must be the same as icon identifiers specified in the icon operation definition file (!JP1\_CS\_FTREE0.conf). For details about the icon operation definition file (!JP1\_CS\_FTREE0.conf), see [Icon operation definition file \(!JP1\\_CS\\_FTREE0.conf\)](#) in *Chapter 2. Definition Files*.

### Example definition

```
#
# All Rights Reserved. Copyright (C) 2003, Hitachi, Ltd.
#
```

```
@file type="function-definition", version="0300";
#-----
@define-block type="function-toolbar-def";
toolbar="sov_JP1_IM_New_Info|sov_JP1_IM_Visual_View|sov_JP1_IM_Function_Tree
|sov_JP1_IM_Central_Console|sov_JP1_IM_Bmv_Help|tool_notepad";
@define-block-end;
#-----
```

## ◆ Icon operation definition file (!JP1\_CS\_FTREE0.conf)

### Format

```
@define-block type="function-tree-def";
id="icon-identifier";
name="tooltip";
iconstandard="icon-storage-path";
icondown="icon-storage-path";
iconrollover="icon-storage-path";
icondisable="icon-storage-path";
execute_id="program-identifier";
arguments="argument";
@define-block-end;
```

### File

!JP1\_CS\_FTREE0.conf (icon operation definition file)

!JP1\_CS\_FTREE0.conf.model (model file for the icon operation definition file)

### Storage directory

*View-path*\conf\sovtoolitem\en\

### Description

This file defines the operation of icons that are displayed on the toolbar in the Monitoring Tree window.

To add a program to the toolbar in the Monitoring Tree window, and then start the program from the toolbar, you must also edit the following definition files:

- Start program definition file
- Toolbar definition file

### When the definitions are applied

The definition takes effect when the Monitoring Tree window is re-opened.

### Information that is specified

From @define-block type to @define-block-end;

Information from @define-block type to @define-block-end; constitutes a single definition block.

To add multiple programs to the toolbar in the Monitoring Tree window, specify this definition block as many times as there are programs to be added. In this definition block, you can specify the following parameters:

`id="icon-identifier";`

Specifies the identifier that indicates the appropriate icon. You can specify from 1 to 32 alphanumeric characters. This character string must be unique within the definition file. Also, the icon identifier specified for this parameter must be the same as the icon identifier specified for the toolbar definition file (`!JP1_CS_FTOOL0.conf`). For details about the toolbar definition file (`!JP1_CS_FTOOL0.conf`), see [Toolbar definition file \(!JP1\\_CS\\_FTOOL0.conf\)](#) in *Chapter 2. Definition Files*.

`name="tooltip";`

Specifies the tooltip that is to be displayed when the cursor is placed on the icon.

`iconstandard="icon-storage-path";`

Specifies the full path of the icon that is to be displayed during normal operation.

`icondown="icon-storage-path";`

Specifies the full path of the icon that is to be displayed when the icon is clicked.

`iconrollover="icon-storage-path";`

Specifies the full path of the icon that is to be displayed when the cursor is moved onto the icon.

`icondisable="icon-storage-path";`

Specifies the full path of the icon that is to be displayed when the corresponding program cannot be started.

`execute_id="program-identifier";`

Specifies an identifier for the program that is to be started. You can specify from 1 to 32 alphanumeric characters. This character string must be unique within the definition file. The program identifier specified in this parameter must be the same as a program identifier that is specified in the start program definition file (`!JP1_CS_APP0.conf`). For details about the start program definition file (`!JP1_CS_APP0.conf`), see [Start program definition file \(!JP1\\_CS\\_APP0.conf\)](#) in *Chapter 2. Definition Files*.

`arguments="arguments";`

Specifies arguments for the program to be started (start path) that is defined in the start program definition file (`!JP1_CS_APP0.conf`). For details about the start program definition file (`!JP1_CS_APP0.conf`), see [Start program definition file \(!JP1\\_CS\\_APP0.conf\)](#) in *Chapter 2. Definition Files*.

## Example definition

```
#-----
# Definition changed by 07-00.
@define-block type="function-tree-def";
id="tool_notepad";
name="Notepad";

### Legend:

(linefeed): Location of a linefeed

#: Item that can be edited (all other items cannot be edited)

### File

Any file (configuration file for monitoring tree)

### Storage directory

Any folder

### Description

This file defines the configuration of the monitoring tree that is displayed in the Monitoring Tree window.

By editing the configuration file for the monitoring tree, you can change the information that is displayed in the monitoring tree, such as the names of monitoring nodes and attribute values of basic information. To create a configuration file for monitoring tree, save the tree configuration locally from the Monitoring Tree window or Monitoring Tree (Editing) window. Do not create a configuration file for monitoring tree by any other method. When you edit the configuration file for monitoring tree, make sure that you do not edit any values other than those described below.

If you have updated an uneditable value by mistake and a backup of the configuration file for monitoring tree is available, use the backup file to update the configuration file for monitoring tree again. If no backup file is available, use the `jcsdbsetup` or `jcsdbimport` command to set up the monitoring object database again.

It is preferable that you use the Monitoring Tree (Editing) window to edit the monitoring tree, unless otherwise necessary.

To use two-byte characters, standardize the character encoding as MS932. No custom characters can be used. Do not enter an escape character.

### When the definitions are applied

The definition takes effect when it is applied to JP1/IM - Manager after this definition file has been opened in the Monitoring Tree (Editing) window.

## Information that is specified

### TREE

The following parameters contained in TREE cannot be changed.

BUILD=*value*

*value* displays the tree generation number. This parameter value is changed by updating at the server.

ID=*value*

*value* displays the tree ID.

DATE=*generation-date-and-time*

*generation-date-and-time* displays the date and time the tree was generated. This parameter's value is updated when a server update is performed and when the status of a monitoring node changes.

CSV\_VER=09000000

This is the CSV file format version. The value might be different depending on the version of JP1/IM - Manager.

MSCOPE={ON | OFF}

Displays whether the monitoring range settings are enabled or disabled. ON means that the monitoring range settings are enabled.

OBJ : *monitoring-node-name*

Displays the name of a monitoring node that is to be displayed in the monitoring tree. The user can change this information. You can specify a character string with a maximum of 255 bytes. Specifiable characters are one-byte alphanumeric characters and two-byte characters (except custom characters). If you use a semicolon (;) in the monitoring node name, enter two consecutive semicolons.

If the monitoring node name contains a comma (,), enclose the entire OBJ item in double-quotation marks (").

Example:

To specify "monitoring,node" as the name of a monitoring node, specify as follows:

"OBJ:monitoring,node"

If you enclose the monitoring node name in double-quotation marks ("), you must enclose the monitoring node name in another set of double-quotation marks and then also enclose the entire OBJ item in double-quotation marks.

Example:

To specify "monitoring node" as the monitoring node name, specify as follows:

"OBJ: ""monitoring node"""

NID : *monitoring-node-ID*

Displays the ID (8 hexadecimal characters) of the monitoring node that is to be displayed in the monitoring tree. The user can change this information.

Make sure that each monitoring node ID is unique. Specify a value in the range from 00000001 to 7FFFFFFF.

ICO : *icon-name*

Displays a maximum of three icon names for the monitoring node, separated by the semicolon (;).

This parameter cannot be changed.

TYPE : *monitoring-node-type*

Displays the ID that identifies the monitoring group, monitoring object, and virtual root node. This parameter cannot be changed.

CLASS : *monitoring-object-type*

Displays the type of monitoring node. This parameter cannot be changed.

STA : *status-ID*

Displays the ID that indicates the status of the monitoring node. This parameter cannot be changed.

CHDT : *status-update-time*

Displays the time the status of the monitoring node was updated. This parameter cannot be changed.

OBS : *monitoring-status*

Displays the monitoring status of the monitoring node. This parameter cannot be changed.

STD : *attribute-name=attribute-value*

Displays the attribute name and attribute value when basic information has been defined for the monitoring node. If multiple basic information items are specified, the items are separated by the semicolon (;).

You can change only *attribute-value*. You can specify a maximum of 1,023 bytes<sup>#</sup> of characters for the attribute value. If you use a semicolon (;) in the attribute value, enter two consecutive semicolons.

<sup>#</sup>: The total length of the field is a maximum of 1,280 bytes (for example, if five basic information items are set, the total length of all five attribute values must be no greater than 1,280 bytes).

If the attribute value contains a comma (,), enclose the entire STD item in double-quotation marks (").

Example:

To specify *attribute,value* as the attribute value, specify as follows:

```
"STD:attribute-name=attribute,value"
```

If you enclose the attribute value in double-quotation marks ("), you must enclose the attribute value in another set of double-quotation marks and then also enclose the entire STD item in double-quotation marks.

Example:

To specify "attribute value" as the attribute value, specify as follows:

```
"STD:attribute-name=""attribute value"""
```

BKIMG=*background-image-file-name*

Displays the name of the background image file that is set in the Visual Monitoring (Editing) window or that is set when the map is displayed in the Monitoring Tree (Editing) window. This parameter cannot be changed.

POT : X=*X-coordinate*; Y=*Y-coordinate*; Z=*Z-coordinate*

Displays the icon location information (coordinates) that is set in the Visual Monitoring (Editing) window or that is set when the map is displayed in the Monitoring Tree (Editing) window. This parameter cannot be changed.

CON

CON includes the parameters shown below. Note that if the value of TYPE is 1 (monitoring group), the CON parameter is not displayed.

NAME=*status-change-condition-name*

Displays the status change condition name. The user can change this information. Specifiable characters are one-byte alphanumeric characters and two-byte characters (except custom characters). None of the following characters can be used: \* " ' \ : ; | = + ? < . >. If the line contains more than one NAME parameter, the same status change condition name cannot be used more than once on that line.

If the status change condition name contains a comma (,), enclose the entire CON item in double-quotation marks (").

Example:

To specify "status change, condition name" as the status change condition name, specify as follows:

```
"CON:NAME=status change,condition name;"
```

```
STA=700;
```

```
individual condition name==individual condition value"
```

*STA=change-status-ID*

Displays the change status ID. This parameter cannot be changed.

*CID=common-condition-ID; common-condition-information*

Displays the common condition ID and the common condition information. For the common condition information, the common conditions that have been set in the Status-Change Condition Settings window, such as the ID and information needed by the system for management purposes, are displayed with the items separated by the semicolon (;). This parameter cannot be changed.

GCON

GCON includes the parameters described below.

Note that the GCON parameter is not displayed if the value of TYPE is 2 (monitoring object) or if no status change condition has been set for the monitoring group.

*NAME=status-change-condition-name*

Displays the status change condition name. The user can change this information. Specifiable characters are one-byte alphanumeric characters and two-byte characters (except custom characters). None of the following characters can be specified: \* " ' \ : ; | = + ? < . >. If the line contains more than one NAME parameter, the same status change condition name cannot be used more than once on that line.

If the status change condition name contains a comma (,), enclose the entire GCON item in double-quotation marks (").

*STA=change-status-ID*

Displays the change status ID. This parameter cannot be changed.

*CSTA=child-node-status-ID*

Displays the status IDs of child nodes. This parameter cannot be changed.

*NUM>=child-nodes-count*

Displays the number of child nodes. This parameter cannot be changed. This parameter and the RATIO parameter are mutually exclusive.

*RATIO>=child-node-ratio*

Displays the ratio of child nodes. This parameter cannot be changed. This parameter and the NUM parameter are mutually exclusive.

*individual-condition-name==individual-condition-value*

Displays an individual condition if it has been set in the Status-Change Condition Settings window. If multiple individual conditions have been specified, they are separated by the semicolon (;). You can change only *individual-condition-value*. The == part depends on the setting in the GUI as shown below; do not change this part.

== (same as)

!= (not same as)

^= (starts with)

>= (includes)

<= (does not include)

\*= (regular expression)

+= (host name comparison)

For *individual-condition-value*, you can specify a maximum of 1,023 bytes<sup>#</sup> of characters. If you use a semicolon (;) in an individual condition value, enter two consecutive semicolons.

<sup>#</sup>: The total length of the field is a maximum of 1,280 bytes (for example, if five individual conditions are set, the total length of all five condition values must be no greater than 1,280 bytes).

If an individual condition value contains a comma ( , ), enclose the entire CON item in double-quotation marks ( " ).

Example:

To specify "individual, condition value" as the individual condition value, specify as follows:

```
"CON:NAME=status change condition name;
```

```
STA=700;
```

```
individual condition name==individual,condition value"
```

If you enclose the individual condition value in double-quotation marks ( " ), you must enclose the individual condition value in another set of double-quotation marks and then also enclose the entire CON item in double-quotation marks.

Example:

To specify ""individual condition value"" as the individual condition value, specify as follows:

```
"CON:NAME=status change condition name,;
```

```
STA=700;
```

```
individual condition name=="individual condition name"""
```

EVE : *STA=status-ID*

Displays the status ID that was set in the event generation condition. This parameter cannot be changed.

RES : *JP1-resource-group-name*

Displays the JP1 resource group name of the monitoring node. This parameter cannot be changed.

OWN : *monitoring-node-owner's-name*

Displays the name of the monitoring node owner. This parameter cannot be changed.

OPE : *list-of-operation-items*

Displays a list of operation items that the login user has for the monitoring node. This parameter cannot be changed.

## Note

- If you change the monitoring node ID, there may be adverse effects on the Visual Monitoring window. This is because the monitoring node IDs are used to manage the monitoring nodes that are displayed in the Monitoring Tree window and the Visual Monitoring window.

If you have changed a monitoring node ID, make sure that there are no problems on the Visual Monitoring window.

## ◆ Definition file for executing applications

### Format

```
@file type="definition-file-type", version="definition-format-version";
# comment-line
@define-block type="application-execution-def";
id="application-execution-definition-identifier";
path="command-path";
description="description-of-application-execution";
@define-block-end;
```

### File

!JP1\_CC\_APP0.conf (definition file for executing applications)

!JP1\_CC\_APP0.conf.model (model file for the definition file for executing applications)

## Storage directory

*View-path*\conf\appexecute\en\

## Description

This file defines the IDs and paths of executable files, such as applications that are started from the Event Console window.

JP1/IM provides the `jcoappexecfcheck` command, which checks the contents of the definition file for executing applications. For details about this command, see *jcoappexecfcheck (Windows only)* in *Chapter 1. Commands*.

## When the definitions are applied

The definition takes effect after JP1/IM - View is restarted.

## Information that is specified

```
@file type="application-execution-definition";
```

Declares that this is the definition file for executing applications. This statement is mandatory.

This statement must be specified on the first line of the file.

```
# comment-line
```

A line beginning with a hash mark (#) is treated as a comment.

### *Application execution definition block*

Defines the path of an executable file, such as an application that is started from the Event Console window, and assigns an ID for purposes of linkage from other definition files.

You can specify the following statements in this block:

- `id` statement
- `path` statement
- `description` statement

If any other statement is written, an error is output, and only the applicable statement is ignored.

The following describes the statements.

```
id="application-execution-definition-identifier" ;
```

Specifies an identifier that is to be assigned to the command path that is specified in this block. This statement is mandatory. You can specify this statement only once in a block.

If the file to be analyzed contains multiple blocks with the same `id`, their priority is determined as follows and only the block that has the highest priority is effective:

1. Last block when the file names are sorted in ascending order
2. Last block in the file

All the other blocks are ignored.

The application execution definition identifier is a character string consisting of no more than 32 alphanumeric characters. This character string must be unique within the definition. To achieve uniqueness, observe the following naming convention:

*company-name*\_*product-name*[\_*function-name*-(or-window-name)]

This cannot be a character string that begins with `jco_` or the character string `default_browser` because they are reserved as application execution definition identifiers.

`path="command-path" ;`

Defines the path of the executable file that is to be associated with the application execution definition identifier specified in the `id` statement. This statement is mandatory. You can specify the `path` statement more than once in the same block. Express the executable file that is to be started as a full path. You can also use a substitute keyword discussed below to assemble a path from data such as the registry.

If you specify this statement more than once, the paths are searched in the order specified and the first path found is used.

In the `path` statement, you can specify an `.exe` or `.bat` file as the executable file.

The current directory is undefined during command execution. A command that uses a relative path from the current directory cannot be specified. Execute such a command after you have executed the `cd` command by using a file such as a `.bat` file.

The search processing executes only when JP1/IM - View starts. Therefore, if you have installed an application to be started while JP1/IM - View is running, you must restart JP1/IM - View.

Note that if you attempt to execute a command located under the `%WINDIR%\System32` folder in the 64-bit edition of Windows, the WOW64 redirection function executes the corresponding command under the `%WINDIR%\SysWow64` folder. If the corresponding command does not exist, command execution might fail. Keep this in mind if you specify a path of an executable file under the `%WINDIR%\System32` folder.

#### *Alternate string*

In the `path` statement, you can specify an alternate string that can be replaced during execution.

##### (1) Alternate keyword string

If the specified definition contains an alternate keyword string, the character string is replaced according to the specified keyword. The format is as follows:

`%alternate-keyword%`

The following table lists the alternate keywords.

**Table 2–97: List of alternate keywords**

| Keyword          | Substitute data                               |
|------------------|-----------------------------------------------|
| JCO_JP1USER      | JP1 user who logged in to JP1/IM - Manager    |
| JCO_INSTALL_PATH | Name of the JP1/IM - View installation folder |

##### (2) Alternate registry string

If the specified definition contains an alternate registry string, the value is acquired from the specified registry to replace the character string. The format of an alternate registry string is as follows:

`[ \registry-key\registry-key\ . . . \registry-value ]`

In an alternate registry string, you can specify the registry-only substitute keyword `%UPPER%`. If you use `%UPPER%`, the character string for the key name is compared within the same hierarchy in the registry key. The purpose of this keyword is to always acquire the most recent version when the key is classified by the version in the registry key.

You can specify `%UPPER%` only once in a registry string. The following example specifies the registry of JP1/SAMPLE using `%UPPER%`:

`[ \HKEY_LOCAL_MACHINE\SOFTWARE\HITACHI\SAMPLE\%UPPER%\PATHNAME\PATH00 ]`

In this example, `%UPPER%` is replaced with the most recent version, so that the most recent executable file is always obtained.

For example, if there are the following two registry keys, the value is acquired from the registry 0700 because 0700 is greater than 0671:

`[ \HKEY_LOCAL_MACHINE\SOFTWARE\HITACHI\SAMPLE\0671\PATHNAME\PATH00 ]`

`[ \HKEY_LOCAL_MACHINE\SOFTWARE\HITACHI\SAMPLE\0700\PATHNAME\PATH00 ]`

```
description="description-of-application-execution";
```

Adds a description to the application execution definition in the block. You can specify this statement only once in a block.

There is no limit to the number of characters, but we recommend that you specify no more than 50 characters.

The following shows an example of an application execution definition block:

```
@define-block type="application-execution-def";
id="HITACHI_JP1_SAMPLE";
path="C:\Program Files\Hitachi\JP1\bin\sample.exe";
description="Hitachi Sample Program";
@define-block-end;
```

## Example definition

The following shows an example of a definition file for executing applications:

```
@file type="application-execution-definition", version="0300";
#-----
@define-block type="application-execution-def";
id="jco_notepad";
path="C:\winnt40\system32\notepad.exe";
@define-block-end;
#-----
@define-block type="application-execution-def";
id="jco_dmp";
path="[\HKEY_LOCAL_MACHINE\SOFTWARE\HITACHI\NETM\DM\P\0521/
A\PathName\Path00]\bin\DMPSTS.exe";
@define-block-end;
```

## ◆ Definition file for the Tool Launcher window

### Format

```
@file type="definition-file-type", version="definition-format-version";
# comment-line
@define-block type="function-tree-def";
folder-definition
function-definition
@define-block-end;
```

### File

!JP1\_CC\_FTREE0.conf (definition file for the Tool Launcher window)

!JP1\_CC\_FTREE0.conf.model (model file for the definition file for the Tool Launcher window)

### Storage directory

*View-path*\conf\function\en\

Description

This file defines tree and item information to be displayed in the Tool Launcher window of JP1/IM - View.

JP1/IM provides the `jcofuncfcheck` command for checking the contents of the definition file for the Tool Launcher window. For details about this command, see *jcofuncfcheck (Windows only)* in *Chapter 1. Commands*.

When the definitions are applied

The definition takes effect after JP1/IM - View is restarted.

Information that is specified

`@file type="function-definition"`  
Declares that this is a definition file for the Tool Launcher window. This statement is mandatory.  
You must always specify `function-definition`.  
This statement must be on the first line of the file.

`version="0300";`  
Specify 0300 for the version.

`# comment-line`  
A line beginning with a hash mark (#) is treated as a comment.

`@define-block type="function-tree-def"; to @define-block-end;`(Tool Launcher definition block)

Tool Launcher definition block

Creates folders or functions that are to be displayed in the Tool Launcher window and specifies application execution definition identifiers to associate the application that is to be executed when a function is chosen.

The functions are displayed in the Tool Launcher window in the order of their file names. Within the same file, the functions are displayed in the order of their definition blocks. You can change the display order of menu items by changing the order of the file names or definition blocks.

The statements that can be specified in this block depend on whether folders or functions are being defined:

Table 2–98: Statements

| When folders are defined                                                                     | When functions are defined                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>id statement</code><br><code>parent_id statement</code><br><code>name statement</code> | <code>id statement</code><br><code>parent_id statement</code><br><code>name statement</code><br><code>execute_id statement</code><br><code>icon statement</code><br><code>arguments statement</code> |

If any other statement is specified, an error is output but only the extraneous statement is ignored.  
The following describes these statements.

`id="menu-identifier";`  
Defines a menu identifier for the menu tree definition block. This statement is mandatory. This statement can be specified only once in a block.  
If the file to be analyzed contains multiple blocks with the same `id`, their priority is determined as follows and only the block that has the highest priority is effective:

1. Last block when the file names are sorted in ascending order

2. Last block in the file

All other blocks are ignored.

Express a menu identifier using from 1 to 32 alphanumeric characters. This character string must be unique within the definition file for the Tool Launcher window. To achieve uniqueness, observe the following naming rules:

- When defining folders

*company-name* [*\_product-name*]

- When defining functions

*company-name* *\_product-name* [*\_function-name-(or-window-name)*]

If an appropriately named folder name already exists, do not add a new folder; use the definition file storage location folder already specified in the other definition file.

"root" cannot be used because it is reserved for the highest menu identifier.

A character string beginning with jco\_ cannot be used because it is reserved as an application execution identifier.

`parent_id="parent-menu-identifier";`

Specifies root or the menu identifier that is located above the local menu identifier in the tree configuration. You can specify a maximum of 3 hierarchical levels, including root. This statement is mandatory. This statement can be specified only once in a block.

You cannot specify multiple parent menu identifiers to create multiple higher folders.

`name="display-name";`

Defines the name that is to be displayed in the Tool Launcher window. This statement is mandatory. This statement can be specified only once in a block.

Specify in *display-name* the character string that is to be displayed in the Tool Launcher window; we recommend that you use a simple but readily understood name. The character string can contain Japanese characters.

We recommend that you use a noun phrase, such as the character string Command Execution Function, because the specified value is displayed in the menu.

Although this value need not be unique in the definition, we recommend that you assign a unique name to eliminate possibilities for confusion.

`execute_id="application-execution-definition-identifier";`

Specifies the identifier for the application execution definition that is to be executed when the function displayed in the Tool Launcher window is double-clicked. If you specify a function, this statement is mandatory. You can specify this statement only once in a block.

You can launch the default browser by specifying "default\_browser" for the `execute_id` parameter. If you specify "default\_browser" for the `execute_id` parameter, specify a URL in the `arguments` parameter.

If you are creating a folder, this statement is ignored if specified.

If the specified application execution definition identifier does not exist, the menu is not displayed.

Note that a character string beginning with jco\_ cannot be used, because it is reserved as the application execution definition identifier.

`icon="display-icon-file-name";`

Specifies the file that contains the icon that is to be displayed in the Tool Launcher window. Specify the full path name of a GIF file. The recommended size for the GIF image is 16 × 16 pixels. If the specified icon image is not this size, it will be resized when the icon is displayed.

You can specify this statement only when you are specifying a function.

If you are creating a folder, this statement is ignored if specified.

If this statement is omitted, the common icon is used.

```
arguments="command-arguments";
```

Specifies arguments for the application specified in `execute_id`. You can use this statement only when you are specifying a function. You can specify this statement only once in a block.

You can also set in `arguments` reserved keywords that will be replaced with the viewer's operating environment attributes or alternate strings for substitution from registry values. For details about alternate strings, see *Alternate string* in [Definition file for executing applications](#) in *Chapter 2. Definition Files*.

If you are creating a folder, this statement is ignored if specified.

The full path of the executable file specified in `execute_id` is linked with the value of `arguments` obtained from the alternate string with a single-byte space added.

Arguments are linked to command line with `[ ]` omitted from before and after

`command-arguments`. In this case, the command cannot be executed if its length exceeds 1,024 characters.

To set string that includes single-byte space as arguments to application, enclose `command-arguments` with `[ ]`. For example `[arguments=""string""]`.

`[ ]` before and after `command-arguments` are omitted when linked to command line. Therefore, when starting Microsoft Edge with the Tool Launcher window, if arguments in alternate string that has been replaced include single-byte space, Microsoft Edge may not operate as intended.

To set string that includes single-byte space as arguments, enclose the string with `[ ]`. For example `[arguments=""string""]`.

The following shows an example definition of a menu tree definition block:

```
@define-block type="function-tree-def";
id="hitachi_jpl";
parent_id="root";
name="Sample management";
@define-block-end;
@define-block type="function-tree-def";
id="hitachi_jpl_seihin_sample";
parent_id="hitachi_jpl";
name="Sample window";
icon="sample.gif";
execute_id="hitachi_jpl_seihin_sample_execute";
arguments="node_map";
@define-block-end;
```

## Example definition

The following shows an example of the definition file for the Tool Launcher window:

```
#
# All Rights Reserved, Copyright (C) 2000, Hitachi, Ltd.
#
@file type="function-definition", version="0300";
#-----
@define-block type="function-tree-def";
id="jco_folder_Network";
parent_id="root";
name="Network Management";
@define-block-end;
```

```
#-----
@define-block type="function-tree-def";
id="jco_JP1_Cm2";
parent_id="jco_folder_Network";
name="Network Management";
icon="%JCO_INSTALL_PATH%\image\menu\cm2_manager.gif";
execute_id="default_browser";
arguments="%JCO_INSTALL_PATH%\conf\webdata\en\hitachi_jp1_cm2.html";
@define-block-end;
#-----
@define-block type="function-tree-def";
id="jco_folder_JobSystemOperation";
parent_id="root";
name="Job System Management";
@define-block-end;
#-----
@define-block type="function-tree-def";
id="jco_JP1_AJS2";
parent_id="jco_folder_JobSystemOperation";
name="Job System Management";
icon="%JCO_INSTALL_PATH%\image\menu\ajs2_manager.gif";
execute_id="jco_JP1_AJS2";
arguments="-t \"%JCO_JP1TOKEN%\"";
@define-block-end;
#-----
```

## ◆ System profile of the Central Scope viewer (system.conf)

### Format

```
DESC_VERSION=1
[SystemProfile]
  FrameVisible={true | false}
  [DisplayColor]
  :
  [ColorItem]
    Status=monitoring-node-status-identifier
    Name=monitoring-node-status-name
    [Label]
      R=value
      G=value
      B=value
      A=value
    [END]
    [TEXT]
      R=value
      G=value
      B=value
    [End]
  [End]
  :
[End]

[End]
```

## File

`system.conf` (System profile of the Central Scope viewer)

`system.conf.model` (Model file of the system profile of the Central Scope viewer)

## Storage directory

For Japanese operating systems:

*View-path*\conf\sovsystem\ja\

For English operating systems:

*View-path*\conf\sovsystem\en\

For Chinese operating systems:

*View-path*\conf\sovsystem\zh\

## Description

Common definition information for Central Scope viewer. Contents of this definition file are applied to the following windows:

- Monitoring Tree (Editing) window
- Visual Monitoring (Editing) window

## When the definitions are applied

The definitions are applied when the Monitoring Tree (Editing) window or the Visual Monitoring (Editing) window is displayed.

## Information that is specified

`Movable` cannot be specified. All other specifications are the same as the system profile of Central Scope (`jcs_sysprofile_xxx.def`). For details, see *System profile of Central Scope (`jcs_sysprofile_xxx.def`)* in *Chapter 2. Definition Files*.

## Notes

Notes specific to the system profile of the Central Scope viewer (`system.conf`) are provided here. For notes on other issues, see *System profile of Central Scope (`jcs_sysprofile_xxx.def`)* in *Chapter 2. Definition Files*.

- The monitoring node in the Monitoring Tree (Editing) and Visual Monitoring (Editing) windows are always initial state. As a result, definitions for other statuses are not applied to the windows.
- If you edit the system profile of the Central Scope viewer (`system.conf`), the changes are not applied to the Monitoring Tree and Visual Monitoring windows. If you want to change settings for these windows, edit the system profile of Central Scope (`jcs_sysprofile_xxx.def`).

## ◆ Performance report display definition file (performance.conf)

### Format

```
# (JP1/PFM - Web Console URL)
[URL-of-JP1/PFM-Web-Console]
```

### File

performance.conf (performance report display definition file)

performance.conf.model (model file for the performance report display definition file)

### Storage directory

In Windows

Physical host:

*Console-path*\conf\console\performance

Logical host:

*shared-folder*\jplcons\conf\console\performance

In UNIX

Physical host:

/etc/opt/jplcons/conf/console/performance

Logical host:

*shared-directory*/jplcons/conf/console/performance

### Description

This file defines the function for displaying the performance report of the host that issued an event. The file defines the URL of the connection-target instance of JP1/PFM - Web Console.

### When the definitions are applied

The settings in the performance report display definition file take effect when you log in to JP1/IM - Manager in JP1/IM - View after the `jco_spmc_reload` command has been executed or when you log in to JP1/IM - Manager in JP1/IM - View after JP1/IM - Manager has been restarted.

### Information that is specified

- Tab characters, leading single-byte spaces, and trailing single-byte spaces are ignored.
- Lines consisting of only single-byte spaces or tab characters and null lines (lines that contain only an end-of-line code) are ignored, and processing continues.
- A line beginning with a hash mark (#) is treated as a comment.

[URL-of-JP1/PFM-Web-Console]

Specify the URL of the connection-target instance of JP1/PFM - Web Console by using single-byte alphanumeric characters and symbols.

For details about the JP1/PFM - Web Console URL, see the applicable JP1/PFM manual.

### *Notes*

For the character encoding of the file, use the same character encoding set for the manager.

## 2.13 JP1/IM - Agent definition files

---

### ◆ Alertmanager configuration file (jpc\_alertmanager.yml)

#### Format

Write in YAML format.

```
:
(Abbreviated)
:
receivers:
- name: 'JP1IMDD'

  webhook_configs:
  - send_resolved: true
    url: 'http://host-name-of-JP1/IM - Agent:20726/ima/api/v1/proxy/service/
imdd/im/api_system/v1/events/transform'
```

#### File

jpc\_alertmanager.yml

jpc\_alertmanager.yml.model (model file)

#### Storage directory

##### ■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

#### Description

This is a configuration file that defines the operation of AlertManager.

#### Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflected when Alertmanager is restarted and when Alertmanager is instructed to reload.

## Information that is specified

For definitions of common placeholders used in the table below, see [About definition of common placeholders for descriptive items in yml file](#).

| Item             | Description                                                    | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value                                                                          |
|------------------|----------------------------------------------------------------|---------------|---------------------------------------|--------------------------------------------------------------------------------------------------------|
| global:          | --                                                             | N             | --                                    | --                                                                                                     |

## ◆ Prometheus configuration file (jpc\_prometheus\_server.yml)

### Format

Write in YAML format.

```

global:
  scrape_interval:      1m
  scrape_timeout:       10s
  evaluation_interval:  1m
  external_labels:
    jpl_pc_prome_hostname: "Monitoring agent host name"
  :
(Abbreviated)
  :
scrape_configs:#
  - job_name: Scrape Job Name

    file_sd_configs:
      - files:
          - Discovery configuration file name

    relabel_configs:
      - target_label: jpl_pc_nodelabel
        replacement: Node exporter
      - regex: (jpl_pc_category|jpl_pc_trendname)
        action: labeldrop
    :
(Abbreviated)
  :
remote_write:
  - url: http://host-name-of-JP1/IM-Agent:20727/ima/api/v1/proxy/service/promscale/api/v1/write
    remote_timeout: 30s
    send_exemplars: false
    queue_config:
      capacity: 10000
      max_shards: 200
      min_shards: 4
      max_samples_per_send: 3000
      batch_send_deadline: 10s
      min_backoff: 100ms
      max_backoff: 10s

```

#

When Script exporter discovery is specified using the HTTP-based *http\_sd\_config* method, specify the direct endpoint to *http\_sd\_configs.url* in *scrape\_configs* in this file.

The following shows the HTTP-based service discovery endpoint for the Script exporter specified in *http\_sd\_configs.url* in *scrape\_configs*.

```
http://installation-host-name:Script-exporter-port-number/discovery
```

In contrast to *file\_sd\_configs*, labels cannot be independently added with *http\_sd\_configs*. Labels must be added using *relabel\_configs*. For details on the labels required, see *1.21.2(10)(b) Scraping definition for Script exporter* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## File

*jpc\_prometheus\_server.yml*

*jpc\_prometheus\_server.yml.model* (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This is a configuration file that defines the operation of the Prometheus server.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When you run the Prometheus server reload API or restart the Prometheus server, it is reflected in the operation of the Prometheus server.

Also, if the value of the `jpl_pc_prome_hostname` label or the scrape definition (definition of the `scrape_configs`) is changed, it will be reflected in the displayed contents of the tree in the integrated operation viewer when the `jddcreatetree` command and the `jddupdatetree` command are executed after performing the above operation.

## Information that is specified

For definitions of common placeholders used in the table below, see [About definition of common placeholders for descriptive items in yml file](#).

| Item                                           | Description                                                                     | Changeability | What You Setup in Your JP1/IM - Agent       | JP1/IM - Agent Defaults Value |
|------------------------------------------------|---------------------------------------------------------------------------------|---------------|---------------------------------------------|-------------------------------|
| global:                                        | --                                                                              | N             | --                                          | --                            |
| [ scrape_interval: <duration>   default = 1m ] | Specify the scrape interval to the target, ranging from 15 seconds to 24 hours. | Y             | Specifies the scrape interval. <sup>#</sup> | scrape_interval:1m            |

| Item |                                                    | Description                                                                                                                                                                                                                                                                                                                                                           | Changeability | What You Setup in Your JP1/IM - Agent                                                                                                                                                        | JP1/IM - Agent Defaults Value                           |

When changing this value from the initial value (1m), review the value of the range vector selector specified in the PromQL statement of the metric definition file (the time range specified by square brackets { }). For the range vector selector, specify a value that is at least twice the scrape interval. If you specify a value less than 2 times, trend information cannot be obtained or trend information cannot be obtained at some times.

Also, when monitoring using Yet another cloudwatch exporter, do not specify a value greater than 10m. If specified, the configuration may not be retrieved when the jddcreatetree command is executed.

- <scrape\_config>

scrape\_config section specifies a set of parameters that describe targets and how to scrape them.

In general, one job is specified in one scrape configuration. In advanced configurations, this is subject to change.

Targets can be statically configured via static\_configs parameters or dynamically discovered using one of the supported service discovery mechanisms.

In addition, relabel\_configs allows you to make advanced changes to targets and their labels before scraping.

- `<static_config>`

The `static_config` allows you to set a list of targets and a set of labels that are common to them. This is a typical way to specify a static target in a scrape configuration.

Note: In the JP1/IM - Agent, it is described in the file specified in the `file_sd_config`.

| Item                             | Description                                                                                                                      | Changeability | What You Setup in Your JP1/IM - Agent             | JP1/IM - Agent Defaults Value |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------------------|-------------------------------|
| targets:                         | Specifies the scrape target. You can specify up to 100.                                                                          | N             | --                                                | --                            |

| labels:                          | Specify the label that you want to set for all metrics retrieved from scrape. You can specify up to 30 of them.                  | N             | --                                                | --                            |
| [ <labelname>:<labelvalue> ... ] | Specify the label name and label value. The label name and label value can be up to 255 bytes each.                              | Y             | Specify if you want to add a label to the metric. | --                            |

#### Legend:

Y: Changeable, N: Not changeable, --: Not applicable

- `<relabel_config>`

You can configure `relabel_config` to edit target labels or exclude specified targets before processing scrapes, remote lights, alert notifications, and so on.

`relabel_config` settings are applied to each target in the order in which they appear in the configuration file.

Initially, the following labels are set for the target:

- For the target job label, the value of the `job_name` of each scrape definition is set.

- The instance label and `__address__` label are set to the string specified in the targets of the discovery configuration file.
- If `__param_[name]` label exists in the target, the URL parameter of the form "`[name]=value`" is set when scraping.
- The target is set to the label specified in labels in the discovery configuration file.

Since Prometheus server scrapes the "host name: port number" set in the `__address__` label, if the value specified for targets is not the "host name: port number" to scrape destination, it is necessary to edit the scrape definition by `relabel_config`.

Labels beginning with `__` are removed from the data after processing such as scraping, remote light, and alert notifications.

If the relabel step needs to store the label value temporarily (as input to subsequent relabel steps), use the `__tmp` label name prefix. This prefix is guaranteed not to be used by Prometheus itself.

| Item                                             | Description                                                                                                                                                                                                              | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value |

Legend:

Y: Changeable, --: Not applicable

- <regex>

Set any valid RE2 regular expression.

Required for replace, keep, drop, and labeldrop actions. Regex is anchored at both ends. To unanchor a regular expression, use `.*[regex].*`.

- <relabel\_action>

Set the relabeling action.

replace:

Match regex against concatenated source\_labels. and the matchgroup reference (\$ {1}, \$ {2}, ...) with that value, and set the target\_label to replacement. If the regex does not match, replacement is not performed.

keep:

Remove targets that do not match the regex concatenated source\_labels.

drop:

Deletes targets that match the regex concatenated source\_labels.

labeldrop:

Match regex to all label names. The matched label is removed from the set of labels.

Configuration Example: User's own scrape definition

If you use user-defined Exporter and define multiple monitoring targets in the discovery configuration file, you must specify regex for the relabel\_config and set the value to the jpl\_pc\_nodelabel.

For scrape defined setup and jpl\_pc\_nodelabel, see 1.21.2(3)(d) Add user-defined Exporter scrape job (for Windows) (optional) in the JPI/Integrated Management 3 - Manager Configuration Guide.

The following three monitoring targets are set in the targets of the discovery configuration file. Set "target1 label", "target2 label", and "target3 label" to the jpl\_pc\_nodelabel as the label name of each IM management node.

```
- targets:
- hostA:target1 label:query-parameter-1-passed-to-exporter
- hostA:target2 label:query-parameter-2-passed-to-exporter
- hostB:target3 label:query-parameter-3-passed-to-exporter
```

Specifying relabel\_config

```
relabel_configs:
- source_labels:[__address__]      +
  target_label: __param_target      | (1)
  regex: ([^:]+):([^.:]+):(.*)      |
  replacement:${3}                  +
- source_labels:[__address__]      + (2)
  target_label:instance              +
- source_labels:[__address__]      + (3)
  target_label:jpl_pc_nodelabel      |
  regex: ([^:]+):([^.:]+):(.*)      |
  replacement:${2}                  +
- target_label: __address__         + (4)
  replacement:localhost:20799        +
```

(1): The value set in \_\_address\_\_ (hostA:target1 label:query-parameter-1-passed-to-Exporter) is split, and the string of query-parameter-1-passed-to-Exporter is set to the \_\_param\_target label. target is the URL parameter when scraping.

(2):I am setting the instance label to the value set for \_\_address\_\_.

(3): The value set in \_\_address\_\_ is split, and the label name (targetX label) of the IM management node is set to the jpl\_pc\_nodelabel label.

(4): The user-defined Exporter scrape destination information (host-name:port-number) is set in the \_\_address\_\_.

- <metric\_relabel\_configs>

Metric relabeling is applied to the sample as the last step before ingestion. It has the same configuration format and action as Target relabeling. Metric relabeling does not apply to automatically generated time series such as up.

This is used to filter out time series that are too expensive to ingest.

- <alert\_relabel\_configs>

Alert relabeling applies to alerts before they are sent to AlertManager.

It has the same configuration format and action as target relabeling. Alert relabeling is applied after the external label.

One use use is to ensure that HA pairs of Prometheus servers with different external labels send the same alert.

- <alertmanager\_config>

alertmanager\_config section specifies the Alertmanager instance to which the Prometheus server sends alerts. It also provides parameters to set how to communicate with these Alertmanagers.

Alertmanager can also be statically set with static\_configs parameters or dynamically discovered using one of the supported service discovery mechanisms.

## ◆ Alert configuration file (jpc\_alerting\_rules.yml)

### Format

Write in YAML format.

```
groups:
  - name: group-name
    rules:
      - alert: alert-name
        expr: Conditional expressions
```

```
for: Period
labels:
  jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
  jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
  jpl_pc_severity: JP1 event severity
  jpl_pc_eventid: Event ID of the JP1 event
  jpl_pc_metricname: Metric Name
annotations:
  jpl_pc_firing_description: Message when firing conditions are met
  jpl_pc_resolved_description: Message when a firing condition is no longer met
```

## File

jpc\_alerting\_rules.yml

jpc\_alerting\_rules.yml.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

A file that defines the alert evaluation rules that the Prometheus server runs.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflected when the Prometheus server is restarted and when you instruct the Prometheus server to reload.

## Information that is specified

For definitions of common placeholders used in the table below, see [About definition of common placeholders for descriptive items in yml file](#).

| Item    |                               | Description                                                                                                                                                                                                                                                                                                                                                                    | Change ability | What You Setup in Your JP1/IM - Agent                                                                                                                                                                                                                                                                         | JP1/IM - Agent Defaults Value |

(alert = <i>alert name</i> )". |

#### Legend:

Y: Changeable, N: Not changeable, --: Not applicable

#

Since the following label is set as an attribute of the JP1 event, do not remove the label by an aggregate operator.

- instance
- job
- jp1\_pc\_nodelabel

- jpl\_pc\_exporter
- jpl\_pc\_remote\_monitor\_instance
- account
- region
- dimension\_*any-string*

Note that the labels `account`, `region`, and `dimension_any-string` apply only when monitoring Yet another cloudwatch exporter metrics.

## Definition example

The following shows an example of an alert definition for each metric written in the model file of the metric definition file.

### ■ Metric alert definition example in *Node exporter metric definition file*

- `cpu_used_rate`<sup>#</sup>

```
groups:
  - name: node_exporter
    rules:
      - alert: cpu_used_rate(Node exporter)
        expr: 80 < (avg by (instance,job,jpl_pc_nodelabel,jpl_pc_exporter) (
rate(node_cpu_seconds_total{mode="system"}[2m])) + avg by (instance,job,jp
l_pc_nodelabel,jpl_pc_exporter) (rate(node_cpu_seconds_total{mode="user"}[
2m])))) * 100
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
          jpl_pc_severity: "Error"
          jpl_pc_eventid: "0301"
          jpl_pc_metricname: "node_cpu_seconds_total"
        annotations:
          jpl_pc_firing_description: "CPU usage has exceeded the threshold (
80%). value={{ $value }}%"
          jpl_pc_resolved_description: "CPU usage has fallen below the thres
hold (80%)."
```

- `memory_unused`<sup>#</sup>

```
groups:
  - name: node_exporter
    rules:
      - alert: memory_unused(Node exporter)
        expr: 1024 > node_memory_MemAvailable_bytes/1024/1024
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
          jpl_pc_severity: "Error"
          jpl_pc_eventid: "0302"
          jpl_pc_metricname: "node_memory_MemAvailable_bytes"
        annotations:
          jpl_pc_firing_description: "The amount of free memory has fallen b
elow the threshold (1024 megabytes).value={{ $value }}megabytes"
```

```
jpl_pc_resolved_description: "The amount of free memory exceeded the threshold (1024 megabytes)."
```

- **memory\_unused\_rate<sup>#</sup>**

```
groups:
  - name: node_exporter
    rules:
      - alert: memory_unused_rate(Node exporter)
        expr: node_memory_MemAvailable_bytes / node_memory_MemTotal_bytes
        * 100 < 10
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
          jpl_pc_severity: "Error"
          jpl_pc_eventid: "0303"
          jpl_pc_metricname: "node_memory_MemAvailable_bytes,node_memory_MemTotal_bytes"
        annotations:
          jpl_pc_firing_description: "Free-memory ratio has fallen below threshold value (10%). value={{ $value }} %"
          jpl_pc_resolved_description: "Free-memory ratio exceeded threshold value (10%). "
```

- **disk\_unused<sup>#</sup>**

```
groups:
  - name: node_exporter
    rules:
      - alert: disk_unused(Node exporter)
        expr: 10 > node_filesystem_free_bytes/(1024*1024*1024)
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
          jpl_pc_severity: "Error"
          jpl_pc_eventid: "0304"
          jpl_pc_metricname: "node_filesystem_free_bytes"
        annotations:
          jpl_pc_firing_description: "Free disk space has fallen below the threshold (10 gigabytes).value={{ $value }}gigabytes, mountpoint={{ $labels.mountpoint }}"
          jpl_pc_resolved_description: "Free disk space exceeded threshold (10 gigabytes).mountpoint={{ $labels.mountpoint }}"
```

- **disk\_unused\_rate<sup>#</sup>**

```
groups:
  - name: node_exporter
    rules:
      - alert: disk_unused_rate(Node exporter)
        expr: node_filesystem_free_bytes / node_filesystem_size_bytes * 100
        < 10
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
```

```

        jpl_pc_severity: "Error"
        jpl_pc_eventid: "0305"
        jpl_pc_metricname: "node_filesystem_free_bytes,node_filesystem_size_bytes"
        annotations:
            jpl_pc_firing_description: "Free disk percentage has fallen below threshold value (10%). value={{ $value }} %, mountpoint={{ $labels.mountpoint }}"
            jpl_pc_resolved_description: "Free disk percentage exceeds threshold value (10%). mountpoint={{ $labels.mountpoint }}"

```

#### Note

If you want to monitor both Node exporter and Node exporter for AIX on a single Prometheus, specify `job` labels in `expr` of the `disk_unused` of Node exporter alert definition to distinguish between metric for Node exporter and Node exporter for AIX, as shown in the underlined part below.

```
10 > node_filesystem_free_bytes{job="jpc_node"}/ (1024*1024*1024)
```

#### • disk\_busy\_rate<sup>#</sup>

```

groups:
- name: node_exporter
  rules:
  - alert: disk_busy_rate(Node exporter)
    expr: 70 < rate(node_disk_io_time_seconds_total[2m])*100
    for: 3m
    labels:
      jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
      jpl_pc_component: "/HITACHI/JP1/JPCCS/CONFINFO"
      jpl_pc_severity: "Error"
      jpl_pc_eventid: "0306"
      jpl_pc_metricname: "node_disk_io_time_seconds_total"
    annotations:
      jpl_pc_firing_description: "Disk busy rate exceeded threshold (70%).value={{ $value }}%, device={{ $labels.device }}"
      jpl_pc_resolved_description: "Disk busy rate has fallen below the threshold (70%).device={{ $labels.device }}"

```

#### Note

If you want to monitor both Node exporter and Node exporter for AIX on a single Prometheus, specify `job` labels in `expr` of the `disk_unused_rate` of Node exporter alert definition to distinguish between metric for Node exporter and Node exporter for AIX, as shown in the underlined part below.

```
Node_filesystem_free_bytes{job="jpc_node"} /
node_filesystem_size_bytes{job="jpc_node"} * 100 < 10
```

#### • disk\_read\_latency<sup>#</sup>

```

```

#

If you define more than one alert in the same monitoring agent host, be careful not to specify duplicate "groups:" or duplicate name with the same group-name.

## ■ Metric alert definition example in *Process exporter metric definition file*

- `process_pgm_process_count`<sup>#</sup>

```
groups:
- name: process_exporter
  rules:
- alert: process_pgm_process_count(Processs exporter)
  expr: 1 > sum by (program, instance, job, jpl_pc_nodelabel, jpl_pc_
```

```

exporter) (namedprocess_namegroup_num_procs)
  for: 3m
  labels:
    jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
    jpl_pc_severity: "Error"
    jpl_pc_eventid: "1308"
    jpl_pc_metricname: "namedprocess_namegroup_num_procs"
  annotations:
    jpl_pc_firing_description: "The number of processes has fallen below the threshold (1 process)."
```

#

This uses a threshold value of 1 as an example. Change this value based on the number of monitoring targets.

When defining multiple alerts with the same integrated agent host, avoid specifying duplicate groups:, or specifying a name that specifies the same group name in duplicate.

- Alert definition example for metrics in "Node exporter (service monitoring) metric definition file"

- `service_state`#

When the auto-start setting of the monitored unit is enabled (systemctl enable is being executed)

```

groups:
- name: node_exporter
  rules:
- alert: service_state(Node exporter)
  expr: node_systemd_unit_state{state="active"} == 0
  for: 3m
  labels:
    jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
    jpl_pc_severity: "Error"
    jpl_pc_eventid: "0320"
    jpl_pc_metricname: "node_systemd_unit_state"
  annotations:
    jpl_pc_firing_description: "The status of the service is not running."
    jpl_pc_resolved_description: "The service status is now running."
```

When the auto-start setting of the monitored unit is disabled

```

groups:
- name: node_exporter
  rules:
- alert: service_state_service-name(Node exporter)
  expr: absent(node_systemd_unit_state{instance="integrated-agent-host-name:port-number-of-the-Node-exporter", job="jpc_node", jpl_pc_exporter="JPC Node exporter", jpl_pc_nodelabel="service-name", state="active"}) == 1
  for: 3m
  labels:
    jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
    jpl_pc_severity: "Error"
    jpl_pc_eventid: "0320"
    jpl_pc_metricname: "node_systemd_unit_state"
  annotations:
    jpl_pc_firing_description: "The status of the service is not running."
```

```
ng."
    jpl_pc_resolved_description: "The service status is now running."
```

#

If you define more than one alert in the same monitoring agent host, be careful not to specify duplicate "groups:" or duplicate name with the same group-name.

#### ■ Metric alert definition example in *Windows exporter metric definition file*

- `cpu_used_rate`<sup>#</sup>

```
groups:
  - name: windows_exporter
    rules:
      - alert: cpu_used_rate(Windows exporter)
        expr: 80 < 100 - (avg by (instance,job,jpl_pc_nodelabel,jpl_pc_exporter) (rate(windows_cpu_time_total{mode="idle"}[2m])) * 100)
        for: 3m
        labels:

```

#

If you define more than one alert in the same monitoring agent host, be careful not to specify duplicate "groups:" or duplicate name with the same group-name.

#### ■ Metric alert definition example in *Windows exporter (process monitoring) metric definition file*

- `process_pgm_process_count`<sup>#</sup>

```
groups:
- name: windows_exporter
  rules:
- alert: process_pgm_process_count(Windows exporter)
  expr: absent(windows_process_start_time{instance="integrated-agent-host-name:Windows-exporter-port-number", job="jpc_windows", jpl_pc_exporter="JPC Windows exporter", jpl_pc_nodelabel="monitored-process-name", process="monitored-process-name"}) == 1
  for: 3m
  labels:
    jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
    jpl_pc_severity: "Error"
    jpl_pc_eventid: "0414"
    jpl_pc_metricname: "windows_process_start_time"
  annotations:
    jpl_pc_firing_description: "The number of processes has fallen below the threshold (1 process)."
```

#

This uses a threshold value of 1 as an example. Change this value based on the number of monitoring targets. When defining multiple alerts with the same integrated agent host, avoid specifying duplicate groups:, or specifying a name that specifies the same group name in duplicate.

- Alert definition example for metrics in "Windows exporter (service monitoring) metric definition file"

- service\_state<sup>#</sup>

```
groups:
  - name: windows_exporter
    rules:
      - alert: service_state(Windows exporter)
        expr: windows_service_state{state="running"} == 0
        for: 3m
        labels:
          jpl_pc_product_name: "/HITACHI/JP1/JPCCS2"
          jpl_pc_severity: "Error"
          jpl_pc_eventid: "0420"
          jpl_pc_metricname: "windows_service_state"
        annotations:
          jpl_pc_firing_description: "The status of the service is not running."
          jpl_pc_resolved_description: "The service status is now running."
```

#

If you define more than one alert in the same monitoring agent host, be careful not to specify duplicate "groups:" or duplicate name with the same group-name.

- Alert definition example for metrics in "Node exporter for AIX metric definition file"

- cpu\_used\_rate<sup>#</sup>

```
groups:
  - name: node_exporter_AIX
    rules:
      - alert: cpu_used_rate(Node exporter for AIX)
        expr: 80 < ((avg by(instance,job,jpl_pc_nodelabel,jpl_pc_exporter) (
          rate(node_cpu{mode="sys"}[2m])))+(avg by(instance,job,jpl_pc_nodelabel,jpl_pc_exporter) ((rate(node_cpu{mode="user"}[2m]))))*100

#

When defining multiple alerts with the same integrated agent host, avoid specifying duplicate groups:, or specifying a name that specifies the same group name in duplicate. In "alert", specify the value of the alert definition while following the naming rule given below. If you do not follow the rule, the JP1 event will not be created.

alert: metric-definition-name(exporter-name)any-value

## ◆ Node exporter discovery configuration file (jpc\_file\_sd\_config\_node.yml)

### Format

Write in YAML format.

```
- targets:
  - Monitored hostname:Port number of the Node exporter
labels:
  jpl_pc_exporter: JPC Node Exporter
  jpl_pc_category: platform
  jpl_pc_trendname: node_exporter
  jpl_pc_multiple_node: "{__name__=~'node_systemd_unit_.*'}"#
```

#

Parameters for service monitoring that are set in the model file by JP1/IM - Agent 13-01 or later installer.

If you are upgrading from JP1/IM - Agent 13-00 to 13-01 or later and want to use the service monitoring feature, add the `jpl_pc_multiple_node` parameters manually. For details, see *2.19.2(3)(f) Configuring service monitor settings (for Linux) (optional)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

### File

`jpc_file_sd_config_node.yml`

`jpc_file_sd_config_node.yml.model` (model file)

### Storage directory

#### ■Integrated agent host

In Linux:

- For a physical host  
`/opt/jplima/conf/`
- For a logical host  
`shared-directory/jplima/conf/`

### Description

This is a file that configures the Node exporter that Prometheus server scrapes.

### Character code

UTF-8 (without BOM)

### Line feed code

LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

- *Monitored hostname:Port number of the Node exporter*

Specify "*Monitored hostname:Port number of the Node exporter*" as characters other than 1 to 2,595 control characters.

The monitored host name is required and specified. The specified monitored host name is set in the monitoring agent installation script. You can also specify the FQDN format.

If you have changed the port number of the Node exporter from the initial value, change the value of the *Port number of the Node exporter*.

## ◆ Process exporter discovery configuration file (`jpc_file_sd_config_process.yml`)

### Syntax

Written in YAML format.

```
- targets:
  - installation-host-name:Process-exporter-port-number
  labels:
    jpl_pc_exporter: JPC Process exporter
    jpl_pc_category: platform
    jpl_pc_trendname: process_exporter
    jpl_pc_multiple_node: "{__name__=~'namedprocess_namegroup_.*'}"
    jpl_pc_agent_create_flag: false
```

### File

`jpc_file_sd_config_process.yml`

`jpc_file_sd_config_process.yml.model` (model file)

### Storage directory

When using a physical host

`/opt/jplima/conf/`

When using a logical host

`shared-directory/jplima/conf/`

### Description

This file configures the Process Exporter to be scraped by the Prometheus server.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

LF

## Timing in which definitions are reflected

The Process Exporter becomes a target for scraping when executing or restarting the Prometheus server reload API. Following this, definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

– *installation-host-name:Process-exporter-port-number*

The *installation-host-name* is set based on the installation script for the integrated agent. This can also be specified in FQDN format.

If the Process exporter port number has changed from its default value, change the *Process-exporter-port-number* value after the colon (:).

Specify the *installation-host-name:Process-exporter-port-number* using 1 to 2,574 characters, excluding control characters.

## ◆ Windows exporter discovery configuration file (jpc\_file\_sd\_config\_windows.yml)

### Format

Write in YAML format.

```
- targets:
  - Monitored hostname:Port number of the Windows exporter
  labels:
    jpl_pc_exporter: JPC Windows Exporter
    jpl_pc_category: platform
    jpl_pc_trendname: windows_exporter
    jpl_pc_multiple_node: "{__name__=~'windows_process_.*|windows_service_.*' }"#
```

#

Parameters that JP1/IM - Agent 13-01 or later installer sets in the model file for process monitoring and service monitoring.

If you are upgrading from JP1/IM - Agent 13-00 to 13-01 or later and want to use the service monitoring feature, add the `jpl_pc_multiple_node` parameters manually. For details, see *1.21.2(3)(f) Configuring service monitoring settings (for Windows) (optional)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## File

`jpc_file_sd_config_windows.yml`

jpc\_file\_sd\_config\_windows.yml.model (model file)

## Storage directory

### ■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder/jplima/conf/*

## Description

This is a file that configures the Windows exporter that Prometheus server scrapes.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

- *Monitored hostname:Port number of the Windows exporter*

Specify "*Monitored hostname:Port number of the Windows exporter*" as characters other than 1 to 2,595 control characters.

The monitored host name is required and specified. The specified monitored host name is set in the monitoring agent installation script. You can also specify the FQDN format.

If you have changed the port number of the Windows exporter from the initial value, change the value of the *Port number of the Windows exporter*.

## ◆ Windows exporter (Hyper-V monitoring) discovery configuration file (jpc\_file\_sd\_config\_windows\_hyperv.yml)

### Format

Write in YAML format.

```
- targets:
  - JPl/IM - Agent-installation-hostname:Windows exporter (Hyper-V monitorin
g)-port-number
  labels:
```

```
jpl_pc_exporter: JPC Windows exporter hyperv
jpl_pc_nodelabel: Hyperv metric collector(Windows exporter hyperv)
jpl_pc_category: VirtualMachine
jpl_pc_agent_create_flag: false
jpl_pc_multiple_node: "{__name__=~'windows_hyperv_vm_cpu_total_run_time|
windows_hyperv_host_.*'}"
```

## File

jpc\_file\_sd\_config\_windows\_hyperv.yml

jpc\_file\_sd\_config\_windows\_hyperv.yml.model (model file)

## Storage destination directory

- Integrated agent host

For Windows

- For physical hosts (definition files and model files)

*Agent-path*\conf\

- Logical host (definition file)

*Shared-folder*\jplima\conf\

## Description

This file is used to set Windows exporter (Hyper-V monitoring) scrape by Prometheus server.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## Time of import of definitions

When Prometheus server reload API is executed or restarted, Prometheus server is subject to scrape. After that, when you execute `jddcreatetree` command and `jddupdatetree` command, it is reflected in the content displayed in integrated operation viewer tree.

## Description

### *JP1/IM - Agent-installation-hostname*

Specifies IP address/hostname of scrape destination Windows exporter (Hyper-V monitoring).

### *Windows exporter (Hyper-V monitoring)-port-number*

Specifies the port number of scrape destination Windows exporter (Hyper-V monitoring).

By default, 20733 is specified.

## ◆ Node exporter for AIX discovery configuration file (jpc\_file\_sd\_config\_node\_aix.yml)

### Format

Write in YAML format.

```
- targets:
  - monitored-host-name:port-number-of-the-Node-exporter-for-AIX
  ...
labels:
  jpl_pc_exporter: JPC Node exporter for AIX
  jpl_pc_category: platform
  jpl_pc_trendname: node_exporter_aix
```

### File

jpc\_file\_sd\_config\_node\_aix.yml

jpc\_file\_sd\_config\_node\_aix.yml.model (model file)

### Storage directory

- Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

### Description

This is a file that configures the Node Exporter for AIX that the Prometheus server scrapes.

### Character code

UTF-8 (without BOM)

### Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected

## Information that is specified

### Monitored host name

Specifies the host name of the monitored host (AIX) in characters other than 1 to 255 control characters. You can also specify FQDN format. "localhost" cannot be specified.

### Node exporter for AIX port number

Specifies the port number of Node exporter for AIX to scrape to.

## Example definition

```
- targets:
  - hostA:20730
  - hostB:20730
labels:
  jpl_pc_exporter: JPC Node exporter for AIX
  jpl_pc_category: platform
  jpl_pc_trendname: node_exporter_aix
```

## ◆ Blackbox exporter (HTTP/HTTPS monitoring) discovery configuration file (jpc\_file\_sd\_config\_blackbox\_http.yml)

### Format

Write in YAML format.

```
- targets:
  - monitored-host-name:IM-management-node-label-name:URL
  ...
labels:
  jpl_pc_exporter: JPC Blackbox Exporter
  jpl_pc_category: serviceResponse
  jpl_pc_trendname: blackbox_exporter
  jpl_pc_remote_monitor_instance: install-host-name: Synthetic metric collector(Blackbox exporter)
```

### File

`jpc_file_sd_config_blackbox_http.yml`

`jpc_file_sd_config_blackbox_http.yml.model` (model file)

`file_sd_config_blackbox_module-name-start-with-http.yml` (user-created)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

A file that configures the Blackbox exporter that Prometheus server scrapes with HTTP/HTTPS monitoring.

If you have newly defined a module in Process exporter configuration file (*jpc\_blackbox\_exporter.yml*) HTTP/HTTPS monitoring, create a discovery configuration file with the following name and copy the model file for this discovery configuration file, depending on the target:

*file\_sd\_config\_blackbox\_module-name.yml*

For details on Blackbox exporter monitoring setup, see *1.21.2(6) Setup of Blackbox exporter* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the *jddcreatetree* and *jddupdatetree* commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

– *monitored-host-name:IM-management-node-label-name:URL*

*Monitored hostname*, *IM Management Node Label Name*, and *URL* are separated by a ":" (colon).

The *Monitored hostname* is a character other than 1 to 255 control characters, and specifies the host name of the web server to be monitored. You can also specify the FQDN format. "localhost" cannot be specified.

The *IM Management Node Label Name* is a character that does not include 1 to 255 characters ":" (colon) and control characters, and specifies the string to be displayed in the IM Manager label name in the Integrated Operations Viewer.

Make sure that the string when encoding the URL cannot exceed 234 bytes (the upper limit is 26 characters when all multibyte characters are used).

A *URL* is a character other than 1 to 2083 control characters that specifies URL to monitor. You can specify IP address instead of Host name in URL, but if you specify IP address, you cannot Enable validation of the monitored certificate (you cannot false in the `insecure_skip_verify` of Process exporter configuration file (`jpc_blackbox_exporter.yml`) `tls_config`). In addition, the following metric cannot be monitored because "true" is Setup to the `insecure_skip_verify` of the `tls_config` of Process exporter configuration file (`jpc_blackbox_exporter`).

- `probe_ssl_last_chain_expiry_timestamp_seconds`

## Example definition

```
- targets:
  - hostB: Metric forwarder(Prometheus server) healthy:http://hostB:20713/-/healthy
  - hostB: Alert forwarder(Alertmanager) healthy:http://hostB:20714/-/healthy
  labels:
    jpl_pc_exporter: JPC Blackbox Exporter
    jpl_pc_category: serviceResponse
    jpl_pc_trendname: blackbox_exporter
    jpl_pc_remote_monitor_instance: hostA: Synthetic metric collector(Blackbox exporter)
```

## ◆ Blackbox exporter (ICMP monitoring) discovery configuration file (`jpc_file_sd_config_blackbox_icmp.yml`)

### Format

Write in YAML format.

```
- targets:
  - host-name-or-IP-address-of-the-monitored-host
  ...
  labels:
    jpl_pc_exporter: JPC Blackbox Exporter
    jpl_pc_category: platform
    jpl_pc_trendname: blackbox_exporter
    jpl_pc_remote_monitor_instance: install-host-name: Synthetic metric collector(Blackbox exporter)
```

### File

`jpc_file_sd_config_blackbox_icmp.yml`

`jpc_file_sd_config_blackbox_icmp.yml.model` (model file)

`file_sd_config_blackbox_module-name-start-with-icmp.yml` (user-created)

### Storage directory

■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This file configures the Blackbox exporter that Prometheus server scrapes with ICMP monitoring.

If you have newly defined a module in Process exporter configuration file (*jpc\_blackbox\_exporter.yml*) ICMP monitoring, create a discovery configuration file with the following name and Copy the model File for this discovery configuration file, depending on the target:

*file\_sd\_config\_blackbox\_module-name.yml*

For details on Blackbox exporter monitoring setup, see *1.21.2(6) Setup of Blackbox exporter* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the *jddcreatetree* and *jddupdatetree* commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

### – *host-name-or-IP-address-of-the-monitored-host*

Specifies the host name or IP address of the monitored host in characters other than 1 to 2,595 control characters. You can also specify the FQDN format. "localhost" cannot be specified.

When displayed in the Integrated Operations Viewer, the string specified for the host name or internet address of the monitored host is displayed as the label of the IM management node of the agent host SID. If you want to specify an IP address for the host to be monitored and display the host name in the label of the IM management node, set the host name definition file (*imdd\_host\_name.conf*) of JP1/IM - Manager and map the IP address to the host name. For details about the host name definition file, see [\*Host name definition file \(imdd\\_host\\_name.conf\)\*](#).

## Example definition

```
- targets:
  - hostB
  - hostC
  labels:
    jpl_pc_exporter: JPC Blackbox Exporter
    jpl_pc_category: platform
    jpl_pc_trendname: blackbox_exporter
    jpl_pc_remote_monitor_instance: hostA: Synthetic metric collector(Blackbox exporter)
```

## ◆ Yet another cloudwatch exporter discovery configuration file (jpc\_file\_sd\_config\_cloudwatch.yml)

### Format

Write in YAML format.

```
- targets:
  - Monitoring agent host name:Yet another cloudwatch exporter port number
  labels:
    jpl_pc_exporter: JPC YA Cloudwatch Exporter
    jpl_pc_trendname: ya_cloudwatch_exporter
    jpl_pc_remote_monitor_instance: Monitoring agent host name: AWS metric collector(Yet another cloudwatch exporter)
```

### File

jpc\_file\_sd\_config\_cloudwatch.yml

jpc\_file\_sd\_config\_cloudwatch.yml.model (model file)

### Storage directory

#### ■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This is a file that configures the Yet another cloudwatch exporter that the Prometheus server scrapes.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

- *Monitoring agent host name: Yet another cloudwatch exporter port number*

Set the *Monitoring agent host name* to the host name where the monitoring module was installed when the monitoring agent was installed. You can also specify the FQDN format.

If you have changed the port number of Yet another cloudwatch exporter from the initial value, change the value of the *Yet another cloudwatch exporter port number*.

## ◆ Promitor discovery configuration file (jpc\_file\_sd\_config\_promitor.yml)

### Syntax

Written in YAML format.

```
- targets:
  - installation-host-name:Promitor-Scraper-port-number
  labels:
    jpl_pc_exporter: JPC Promitor
    jpl_pc_trendname: promitor
    jpl_pc_remote_monitor_instance: installation-host-name:Azure metric collector (Promitor)
    jpl_pc_rm_agent_create_flag: false
```

### File

`jpc_file_sd_config_promitor.yml`

`jpc_file_sd_config_promitor.yml.model` (model file)

## Storage directory

For Windows

When using a physical host

*Agent-path\conf\*

When using a logical host

*shared-folder\jplima\conf\*

For Linux

When using a physical host

*/opt/jplima/conf/*

When using a logical host

*shared-directory/jplima/conf/*

## Description

This file configures the Promitor to be scraped by the Prometheus server.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

The Promitor becomes a target for scraping when executing or restarting the Prometheus server reload API. Following this, definitions are reflected in the contents of the integrated operation viewer tree view when the *jddcreatetree* command and the *jddupdatetree* command are executed.

## Content description

– *installation-host-name:Promitor-Scraper-port-number*

The *installation-host-name* is set based on the installation script for the integrated agent. This can also be specified in FQDN format.

If the Promitor Scraper port number has changed from its default value, change the *Promitor-Scraper-port-number* value after the colon (:).

## ◆ OracleDB exporter discovery configuration file (jpc\_file\_sd\_config\_oracledb.yml)

### Format

Write in YAML format.

```
- targets:
  - Oracle Database hostname:Monitored name:OracleDB exporter port number
  ...
labels:
  jpl_pc_exporter: JPC OracleDB exporter
  jpl_pc_category: database
  jpl_pc_trendname: oracledb_exporter
  jpl_pc_remote_monitor_instance: install-host-name:OracleDB metric collec
tor(OracleDB exporter)
```

## File

jpc\_file\_sd\_config\_oracledb.yml

jpc\_file\_sd\_config\_oracledb.yml.model (model file)

## Storage directory

- Integrated agent host

In Windows:

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This is a file that configures the OracleDB exporter that Prometheus server scrapes.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

### Oracle Database hostname

Specify the hostname of Oracle **Database**, between 1 and 253 characters. You can also specify FQDN format. "localhost" cannot be specified.

### Monitored name

Specifies an optional name to distinguish between monitored objects. Specifies a character string that is not a colon (:), or control character and that appears in IM management node labelname for integrated operation viewer. When URL is encoded, the character string must be between 1 and 234 bytes (the upper limit for all multibyte characters is 26 characters).

### OracleDB exporter port-number

Specifies the port number of OracleDB exporter to scrape to.

### Hostname to install to

Specifies the host name of the host on which OracleDB exporter is running.

## Definition example

```
- targets:
  - ORAHOST1:Accounting department DB:30001
  - ORAHOST1:Human resources DB:30002
labels:
  jpl_pc_exporter: OracleDB Exporter
  jpl_pc_category: database
  jpl_pc_trendname: oracledb_exporter
  jpl_pc_remote_monitor_instance: hostA: OracleDB metric collector(OracleDB exporter)
```

## ◆ Script exporter discovery configuration file (jpc\_file\_sd\_config\_script.yml)

### Syntax

Written in YAML format.

```
- targets:
  - installation-host-name:Script-exporter-port-number
labels:
  jpc_pc_exporter: JPC Script exporter
  jpc_pc_trendname: script_exporter
  jpl_pc_multiple_node: "{job='jpc_script.*',jpl_pc_multiple_node=''}"
  jpl_pc_agent_create_flag: false
```

### File

jpc\_file\_sd\_config\_script.yml

jpc\_file\_sd\_config\_script.yml.model (model file)

## Storage directory

For Windows

When using a physical host

*Agent-path\conf\*

When using a logical host

*shared-folder\jplima\conf\*

For Linux

When using a physical host

*/opt/jplima/conf/*

When using a logical host

*shared-directory/jplima/conf/*

## Description

This file configures the Script exporter to be scraped by the Prometheus server.

When Script exporter discovery is specified using the file-based *file\_sd\_config* method, specify this file to *file\_sd\_configs* in *scrape\_configs* in the Prometheus configuration file (*jpc\_prometheus\_server.yml*).

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

The Script exporter becomes a target for scraping when executing or restarting the Prometheus server reload API. Following this, definitions are reflected in the contents of the integrated operation viewer tree view when the *jddcreatetree* command and the *jddupdatetree* command are executed.

## Content description

– *installation-host-name : Script-exporter-port-number*

The *installation-host-name* is set based on the installation script for the integrated agent. This can also be specified in FQDN format.

If the Script exporter port number has changed from its default value, change the *Script-exporter-port-number* value after the colon (:).

## ◆ Web exporter discovery configuration file (*jpc\_file\_sd\_config\_web.yml*)

### Format

Write in YAML format.

```
- targets:
  - monitored hostname:IM management node label name:Web scenario filename
    labels:
      jpl_pc_exporter: JPC Web exporter
      jpl_pc_category: serviceResponse
      jpl_pc_trendname: web_exporter
      jpl_pc_remote_monitor_instance: install-host-name:Synthetic web metric c
collector(Web exporter)
```

## File

jpc\_file\_sd\_config\_web.yml

jpc\_file\_sd\_config\_web.yml.model (model file)

file\_sd\_config\_web\_*any-name*.yml (created by user)

## Storage directory

- Integrated agent host

In Windows:

- For a physical host (definition file or model file)  
*Agent-path*\conf\
- For a logical host (definition file)  
*shared-folder*\jplima\conf\

## Description

This is a file that configures the Web exporter that Prometheus server scrapes.

If you have added a new scrape job in Prometheus configuration file to monitor Web scenarios, copy the model file for this file and create a discovery configuration file with the following name:

file\_sd\_config\_web\_*any-name*.yml

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

- *Monitored hostname:IM management node label name:Web scenario filename*

Specify the *monitored hostname*, *IM management node label name*, and *Web scenario filename* separated by ":" (colon).

The *monitored hostname* is a character other than 1 to 255 control characters and specifies the host name of the monitored Web servers. You can also specify FQDN format. "localhost" cannot be specified. In `targets`, the same name cannot be described more than once in *IM management node label name* and *Web scenario filename*. When creating a user-specific Web exporter discovery configuration file (`file_sd_config_web_any-name.yml`), the same name as *IM management node label name* and *Web scenario filename* described in the `targets` of the another Web exporter discovery configuration file cannot be described.

The *IM management node label name* is ":" (colon) and a character that does not contain any control characters, and specifies the string to be displayed in the label name of IM management node in integrated operation viewer. When URL is encoded, the character string must be 234 bytes or less (the upper limit for multibyte characters is 26).

The *Web scenario filename* specifies Web scenario file to use for testing.

Specify "*Monitored hostname:IM management node label name:Web scenario filename*" in characters other than 1 to 2,574 control characters.

## Example definition

```
- targets:
  - web1:Web2ApplicationA:webscenal.spec.ts
  - web2:Web2ApplicationB:webscena2.spec.ts
  labels:
    jpl_pc_exporter: JPC Web exporter
    jpl_pc_category: serviceResponse
    jpl_pc_trendname: web_exporter
    jpl_pc_remote_monitor_instance: hostname1:Synthetic web metric collector
(Web exporter)
```

## ◆ Web scenario file (any-name.spec.ts)

### Format

Write in spec.ts file format.

```
import { test, expect } from '@playwright/test';

test.use({
  locale: 'ja-JP'
});

test('test', async ({ page }) => {
  await page.goto('http://host-name:20703/login');
  await page.locator('input[name="username"]').fill('user-name');
  await page.locator('input[name="password"]').fill('password');
  await page.getByRole('button', { name: 'login' }).click();
  await expect(page.getByRole('button', { name: 'logout' })).toBeVisible();
  await page.getByRole('button', { name: 'logout' }).click();
  await expect(page.getByRole('button', { name: 'login' })).toBeVisible();
});
```

## File

*any-name.spec.ts*

The following characters can be used in file names: Filenames that use other characters cannot be monitored by Web scenario monitoring function.

- Half-width English uppercase letters, half-width English lowercase letters
- One-byte numbers
- Hyphen (-)
- Underscore (\_)
- Half-width period (.)

## Storage directory

### ■ Integrated manager host

In Windows

- For a physical host  
*Agent-path\lib\playwright\tests\*
- For a logical host  
*shared-folder\jplima\lib\playwright\tests\*

## Description

Web scenario monitor feature uses Web scenario described in this file.

Web scenario files are created using the `playwright codegen` command and are used when executing a Web scenario.

This file cannot be edited.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF or LF

## When the definitions are applied

Reflected when Web exporter executes Web scenario.

## ◆ VMware exporter discovery configuration file (jpc\_file\_sd\_config\_vmware.yml)

## Format

Write in YAML format.

```
- targets:
  - VMware exporter hostnema:Port number of the VMware exporter
  labels:
    jpl_pc_exporter: JPC VMware exporter
    jpl_pc_category: virtualMachine
    jpl_pc_remote_monitor_instance: install-host-name:VMware metric collector (VMware exporter)
    jpl_pc_multiple_node: "{__name__=~'vmware_host_.*|vmware_vm_.*|vmware_datastore_.*'}"
    jpl_pc_rm_agent_create_flag: false
```

## File

jpc\_file\_sd\_config\_vmware.yml

jpc\_file\_sd\_config\_vmware.yml.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host (definition file or model file)  
*Agent-path\conf\*
- For a logical host (definition file)  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host (definition file or model file)  
*/opt/jplima/conf/*
- For a logical host (definition file)  
*shared-folder/jplima/conf/*

## Description

This is a file that configures the VMware exporter that Prometheus server scrapes.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

### *VMware exporter hostnema*

Specifies IP or hostname of VMware exporter to scrape to.

### *Port number of the VMware exporter*

Specifies the port number of VMware exporter to scrape to.

By default, 20732 is specified.

If you want to monitor multiple hosts, add scrape jobs in the Prometheus configuration file (jpc\_prometheus\_server.yml).

## Example definition

```
- targets:
  - VMware exporter host: 20732
  labels:
    jpl_pc_exporter: JPC VMware exporter
    jpl_pc_category: virtualMachine
    jpl_pc_remote_monitor_instance: hostname1:VMware metric collector (VMware exporter)
    jpl_pc_multiple_node: "{__name__=~'vmware_host_.*|vmware_vm_.*|vmware_datastore_.*'}"
    jpl_pc_rm_agent_create_flag: false
```

## ◆ SQL exporter discovery configuration file (jpc\_file\_sd\_config\_mssql.yml)

### Format

Write in YAML format.

```
- targets:
# - hostname-of-SQL-exporter:port-number-of-SQL-exporter
  labels:
    jpl_pc_exporter: JPC SQL exporter
    jpl_pc_category: database
    jpl_pc_trendname: sql_exporter
    jpl_pc_remote_monitor_instance: installation-destination-hostname:MSSQL metric collector (SQL exporter)
    jpl_pc_multiple_node: "{__name__=~'mssql_.*'}"
    jpl_pc_rm_agent_create_flag: false
```

### File

jpc\_file\_sd\_config\_mssql.yml

jpc\_file\_sd\_config\_mssql.yml.model (model file)

## Storage destination directory

- Integrated agent host

For Windows

- For physical hosts (definition files and model files)

*Agent-path\conf\*

- Logical host (definition file)

*Shared-folder\jplima\conf\*

## Description

Files that set SQL exporter that Prometheus server will scrape.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## Time of import of definitions

When Prometheus server reload API is executed or restarted, Prometheus server is subject to scrape. After that, when you execute `jddcreatetree` command and `jddupdatetree` command, it is reflected in the content displayed in integrated operation viewer tree.

## Description

*hostname-of-SQL-exporter*

Specifies the hostname of SQL exporter to scrape to, using characters other than 1 to 253 control characters. You can also specify FQDN format. "localhost" cannot be specified.

*port-number-of-SQL-exporter*

Specifies the port number of SQL exporter to scrape to.

*installation-destination-hostname*

Specifies the host name of the host on which SQL exporter is running.

## Definition example

```
- targets:
  - hostA:20735
  labels:
    jpl_pc_exporter: JPC SQL exporter
    jpl_pc_category: database
    jpl_pc_trendname: sql_exporter
    jpl_pc_remote_monitor_instance: hostA:MSSQL metric collector(SQL exporte
r)
    jpl_pc_multiple_node: "{__name__=~'mssql_.*'}"
    jpl_pc_rm_agent_create_flag: false
```

## ◆ User-specific discovery configuration file (user\_file\_sd\_config\_any-name.yml)

### Format

Write in YAML format.

```
- targets:
  - monitored host name[:Any string]
  ...
  labels:
  [ jpl_pc_exporter: Any exporter name that does not start with "JPC"]
  [ jpl_pc_category: IM Management Node Category ID]
  [ jpl_pc_trendname: Prometheus Trend Name]
  [ jpl_pc_remote_monitor_instance: Installation Hostname:The string to display in the label of the IM Management node]
  [ jpl_pc_rm_agent_create_flag: Remote-agent-SID-creation-flag]
  [ jpl_pc_agent_create_flag: agent-SID-creation-flag]
  [ jpl_pc_multiple_node: condition-for-get-label-set-for-multiple-IM-management-node-creation]
```

### File

user\_file\_sd\_config\_any-name.yml

### Storage directory

It can be stored in any directory. However, when storing under the directory where the monitoring agent is installed, store it in the following directory.

#### ■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

### Description

This is a file that sets what Prometheus server scrapes. User-created exporters can also be subject to scraping.

### Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When the Prometheus server reload API is executed or restarted, the Prometheus server is subject to scraping. Then, when the `jddcreatetree` and `jddupdatetree` commands are executed, the contents of the tree display in the integrated operations viewer are reflected.

## Information that is specified

### – *monitored host name[:Any string]*

Specify "*monitored host name[:Any string]*" as characters other than 1 to 2,574 control characters.

The *monitored host name* is a character other than 1 to 255 control characters and is specified as required. You can also specify the FQDN format. "localhost" cannot be specified.

Specify any string if other specifications are required in the Exporter specification.

In Prometheus configuration file (`jpc_prometheus_server.yml`) scrape definition, `relabel_configs` is Setup and the required string is passed as an argument at scrape time.

If you have more than 2,574 characters, in Prometheus configuration file (`jpc_prometheus_server.yml`) `relabel_configs`, replace instance labeled Value with a non-control character from 1 to 2574. Note that instance label Value must be specified in the format of "Monitored Host name: Arbitrary character string" and must not overlap with Value of other instance labels in the same monitoring agent host.

For setup of the `relabel_configs`, see the section describing *Information that is specified in [Prometheus configuration file \(jpc\\_prometheus\\_server.yml\)](#)*.

### `jpl_pc_exporter`: *Any exporter name that does not start with "JPC"*

For *Any exporter name that does not start with "JPC"*, specify the character string to be displayed in the properties of the `jpl_pc_exporter` in the property display with characters other than 1 to 255 control characters. If omitted, "Unknown Exporter" is displayed.

### `jpl_pc_category`: *category-ID-for-IM-management-node*

For the *category-ID-for-IM-management-node*, specify the IM Management node category identifier of the agent SID in characters other than 1 to 255 control characters.

If the specification is omitted, "otherApplications" is assumed to be specified.

### `jpl_pc_trendname`: *Prometheus-trend-name*

For *Prometheus-trend-name*, specify the Prometheus trend name of the metric definition file to be displayed on the IM management node of the agent SID in characters other than 1 to 255 control characters.

If the specification is omitted, job labeled Value is turned Setup.

### `jpl_pc_remote_monitor_instance`: *install-host-name-string-to-be-labeled-with-IM-management-node*

Specify only for exporters that you want to monitor remotely. A remotely monitored exporter is an exporter that monitors a host other than the one on which the exporter is set up.

For the installation host name, specify the host name on which the exporter was installed, in characters other than 1 to 255 control characters.

The string to be displayed on the label of IM management node is the string to be displayed on the label of IM management node in Remote Monitoring service SID with a control character and a character other than a colon. Because a colon is a delimiter, if specified, the string after the last specified colon is subject to the string labeled IM management node. When URL is encoded, the character string must be 234 bytes or less (the upper limit for multibyte characters is 26).

Specify a colon delimiter between the install Host name and the string labeled in IM management node. If not specified, it performs considering Installed Host name and the text labeled in IM management node identical.

If you omit this option, the utility does not create an Remote Monitoring serviced SID.

`jpl_pc_rm_agent_create_flag`: Remote agent SIDs Creation Flag

Specify this option only for Exporter monitored by remote. Specify true or false. It is not case sensitive. If no `jpl_pc_remote_monitor_instance` is specified, this Setup is ignored.

- true  
Create a IM management node for "Remote agent SID" in units of "agent host SID" and "Monitored Host name: Any String".
- false  
Do not create IM management node for "Remote agent SID" in units of "agent host SID" and "Monitored Host name: Any String".

If a character other than true or false is specified, or the specified character is omitted, the utility assumes that true is specified.

`jpl_pc_agent_create_flag`: creation flag of agent SID

Specify this option only for Exporter is monitoring the host where Exporter is installed. Specify true or false. It is not case sensitive. If the `jpl_pc_remote_monitor_instance` is specified, this Setup is ignored.

- true  
Create a IM management node for "agent SID" in units of "Monitored Host name: Any String".
- false  
Do not create a IM management node for agent SID in units of "Monitored Host name: Any String".

If a character other than true or false is specified, or the specified character is omitted, the utility assumes that true is specified.

`jpl_pc_multiple_node`: Condition for Get Label Set for Multiple IM management node Creation

Specifies that more than one IM management node (agent SIDs or Remote agent SIDs) is to be created for the "Monitored Host name: Any String." Specifies the conditions to obtain the labels required to create IM management node from Trend data Management Database.

You can specify only one condition. For details about Value that can be specified, see the description of match parameter in [4.5.18 \*jplTrendDataService.getLabelList\*](#).

If this option is omitted, the utility does not create more than one IM management node (agent SIDs or Remote agent SIDs) for the "Monitored Host name: Any String".

## Example definition

```
- targets:
- hostA:9256
labels:
  jpl_pc_exporter: Process Exporter
  jpl_pc_category: platform
  jpl_pc_trendname: process
```

## ◆ Service definition file (jpc\_program-name\_service.xml)

### Format

- For JPI/IM agent control base (imagent, imagentproxy, imagentaction) and OSS<sup>#</sup> services that do not support the add-on administration function

```
<service>
  <id>service-ID</id>
  <name>display-name-of-the-service</name>
  <description>description</description>
  <workingdirectory>working-directory</workingdirectory>
  <env name="environment-variable-name" value="value"></env>
  <executable>"program-path"</executable>
  <arguments>arguments-of-the-program</arguments>
  <startmode>type-of-startup</startmode>
  <logpath>log-output-directory</logpath>
  <log mode="roll-by-size">
    <sizeThreshold>log-file-size</sizeThreshold>
    <keepFiles>Number of log faces</keepFiles>
  </log>
  <stoptimeout>Termination timeout period</stoptimeout>
</service>
```

- For OSS<sup>#</sup> servicesthat support the add-on administration function

```
<service>
  <id>service-ID</id>
  <name>display-name-of-the-service</name>
  <description>description</description>
  <workingdirectory>working-directory</ workingdirectory>
  <env name="environment-variable-name" value="value"></env>
  <executable>"path-of-OSS-wrapper-program"</executable>
  <arguments>
    "OSS-program-path"
    arguments-of-the-OSS-program
  </arguments>
  <startmode>startup-type</startmode>
  <logpath>log-output-directory</logpath>
  <log mode="roll-by-size">
    <sizeThreshold>log-file-size</sizeThreshold>
    <keepFiles>Number of log faces</keepFiles>
  </log>
  <stoptimeout>Termination timeout period</stoptimeout>
  <env name="IMA_OSSWRAPPER_RESTART_INTERVAL" value="interval-at-which-OSS-w
rapper-restarts-processes"/>
</service>
```

#

For details about OSS corresponding to add-on administration function, see *3.15 Monitoring function by JPI/IM - Agent* in the *JPI/Integrated Management 3 - Manager Overview and System Design Guide*.

### File

- For a physical host

```
jpc_program-name_service.xml
jpc_program-name_service.xml.model (model file)
```

- For a logical host  
jpc\_program-name\_service\_logical-host-name.xml

## Storage directory

### ■Integrated agent host

- For a physical host (Model File storage destination)  
*Agent-path*\conf\
- For Physical host and Logical host (storage destination of definition file)  
*Agent-path*\bin\

## Description

This is the definition file of the Windows serviced program.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## When the definitions are applied

If you change <startmode> in the definition file, it will take effect by reinstalling the service. For each JP1/IM agent control base or add-on program service, reinstall the service using the commands listed in the following tables.

| Add-on program or JP1/IM agent control base | Service name                                | Command                                     |
|---------------------------------------------|---------------------------------------------|---------------------------------------------|
| Prometheus server                           | jpc_prometheus_server_service.exe           | jpc_prometheus_server_service.exe           |
| Alertmanager                                | jpc_alertmanager_service.exe                | jpc_alertmanager_service.exe                |
| Windows exporter                            | jpc_windows_exporter_service.exe            | jpc_windows_exporter_service.exe            |
| Windows exporter (Hyper-V monitoring)       | jpc_windows_exporter_hyperv_service.exe     | jpc_windows_exporter_hyperv_service.exe     |
| Blackbox exporter                           | jpc_blackbox_exporter_service.exe           | jpc_blackbox_exporter_service.exe           |
| Yet another cloudwatch exporter             | jpc_ya_cloudwatch_exporter_service.exe      | jpc_ya_cloudwatch_exporter_service.exe      |
| Promitor                                    | jpc_promitor_scraper_service.exe            | jpc_promitor_scraper_service.exe            |
|                                             | jpc_promitor_resource_discovery_service.exe | jpc_promitor_resource_discovery_service.exe |
| Script exporter                             | jpc_script_exporter_service.exe             | jpc_script_exporter_service.exe             |
| Fluentd                                     | jpc_fluentd_service.exe                     | jpc_fluentd_service.exe                     |
| Web exporter                                | jpc_web_exporter_service.exe                | jpc_web_exporter_service.exe                |
| VMware exporter                             | jpc_vmware_exporter_service.exe             | jpc_vmware_exporter_service.exe             |
| SQL exporter                                | sql_exporter_service.exe                    | sql_exporter_service.exe                    |

| Add-on program or JP1/IM agent control base | Service name                  | Command                       |
|---------------------------------------------|-------------------------------|-------------------------------|
| imagent                                     | jpc_imagent_service.exe       | jpc_imagent_service.exe       |
| imagentproxy                                | jpc_imagentproxy_service.exe  | jpc_imagentproxy_service.exe  |
| imagentaction                               | jpc_imagentaction_service.exe | jpc_imagentaction_service.exe |

If you change the <arguments> or <stoptimeout> of File, it is reflected by Restart of the service.

## Information that is specified

| Item      | Description                                                                                                                                                                                                                             | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| --config.file="jpc_prometheus_server.yml"         | Specifies the path to the Prometheus configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Y             | --                                                                               | --config.file="Agent-path/jplima/conf/jpc_prometheus_server.yml" |
| --web.listen-address="0.0.0.0:9090"               | Specify the listening port. If you want to limit the listening IP address, also include the host name or internet address. If you specify a host name, you can specify up to 255 bytes.<br><Configuration example><br>To accept requests for all IP addresses, set the following:<br>--web.listen-address="0.0.0.0:20713"<br>If you want to limit the IP addresses that are accepted, you can specify a host name or an internet address as follows:<br>--web.listen-address="host-name-or-IP-address:20713" | Y             | Specify this when you want to change the port or limit the listening IP address. | --web.listen-address="0.0.0.0:20713"                             |
| --web.read-timeout=5m                             | Specifies the maximum amount of time before reading requests times out and idle connections are closed.                                                                                                                                                                                                                                                                                                                                                                                                      | N             | --                                                                               | --web.read-timeout=5m                                            |
| --web.max-connections=512                         | Specifies the maximum number of concurrent connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                      | N             | --                                                                               | --web.max-connections=10                                         |
| --web.enable-lifecycle                            | Specifies to enable shutdown and reload by HTTP request.                                                                                                                                                                                                                                                                                                                                                                                                                                                     | N             | --                                                                               | --web.enable-lifecycle                                           |
| --storage.tsdb.path="data/"                       | Specify the path where you want to save the performance data.                                                                                                                                                                                                                                                                                                                                                                                                                                                | N             | --                                                                               | --storage.tsdb.path="data/prometheus_server/"                    |
| --storage.tsdb.min-block-duration=2h              | Specifies the minimum duration of the block.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | N             | --                                                                               | --storage.tsdb.min-block-duration=1h                             |
| --storage.tsdb.max-block-chunk-segment-size=512MB | Specifies the maximum size of a single chunk segment in a block.                                                                                                                                                                                                                                                                                                                                                                                                                                             | N             | --                                                                               | --storage.tsdb.max-block-chunk-segment-size=32MB                 |

| Item                                                      | Description                                                                                                                                                                                                                                                | Changeability | What You Setup in Your JP1/IM - Agent                                                                         | JP1/IM - Agent Defaults Value         |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------|---------------------------------------|
| --storage.tsdb.retention.time=STORAGE.TSDB.RETENTION.TIME | Specify the retention period of performance data in hours or days. <ul style="list-style-type: none"> <li>Hourly: Specify from 1h to 360h.</li> <li>Daily: Specify from 1d to 15d.</li> </ul> <Configuration example><br>--storage.tsdb.retention.time=24h | Y             | If a range vector selector is used for the alert rule condition, specify a value greater than that range.     | --storage.tsdb.retention.time=1h      |
| --storage.remote.flush-deadline=<duration>                | Specify the maximum waiting time when stopping when remote lights and alerts cannot be sent.                                                                                                                                                               | N             | --                                                                                                            | --storage.remote.flush-deadline=5s    |
| --rules.alert.for-outage-tolerance=1h                     | Specifies the maximum Prometheus server outage period for which the alert "pending" state can be restored.                                                                                                                                                 | N             | --                                                                                                            | --rules.alert.for-outage-tolerance=1h |
| --rules.alert.for-grace-period=10m                        | Specifies the minimum duration of the "for" state when restored from an alert. Valid only for alerts that have a longer "for" time than this option.                                                                                                       | N             | --                                                                                                            | --rules.alert.for-grace-period=10m    |
| --log.level=info                                          | Only messages above the specified level are logged.<br>You can specify one of the following levels: debug, info, warn, or error.                                                                                                                           | N             | Change Setup when you are prompted to change Value from the support desk.<br>Normally, no change is required. | --log.level=debug                     |

- `sql_exporter` command options

| Item name           | Description                                                                                                            | Changeability | What You Set Up with JP1/IM - Agent                                                                             | JP1/IM - Agent Defaults |
|---------------------|------------------------------------------------------------------------------------------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------|-------------------------|
| --config.file       | Specifies SQL exporter configuration file path.<br>The values set in this file are overridden by command line options. | N             | --                                                                                                              | sql_exporter.yml        |
| --log.format        | Sets the output format for log messages.                                                                               | N             | --                                                                                                              | logfmt                  |
| --log.level         | Outputs only messages above the specified level to the log.<br>One of debug, info, warn, error can be specified.       | N             | Normally, no change is required.<br>Change the setting when the support desk instructs you to change the value. | info                    |
| -web.listen-address | Specify the listen port. If you restrict IP addresses to listen to, also include the hostname or IP address.           | Y             | Specify this when you want to change the port or when you want to limit IP addresses to be listened to.         | 20735                   |
| -web.metrics-path   | Specify the path to publish the metric.                                                                                | N             | --                                                                                                              | /metrics                |

## ◆ Unit definition file (`jpc_program-name.service`)

### Format

- For JP1/IM agent control base (imagent, imagentproxy, imagentaction) and OSS<sup>#1</sup> services that do not support the add-on administration function

```
[Unit]
Description = Unit description
After=local-fs.target remote-fs.target rsyslog.service network.target
[Service]
WorkingDirectory = Working directory
```

```

ExecStart = /bin/sh -c 'Program Command Line |& (trap "" 15 && exec install
-directory/jplima/bin/rotatelog -n 8#2 log output directory#3 10240K) '
Type = simple
Restart=no
User=root
TimeoutStopSec=Termination timeout period
LimitNOFILE=65536#4
Environment=SIGDUMP_PATH=-#4
[Install]
WantedBy=multi-user.target graphical.target

```

- For OSS<sup>#1</sup> services that support the add-on administration function

```

[Unit]
Description = Unit description
After=local-fs.target remote-fs.target rsyslog.service network.target
[Service]
WorkingDirectory = Working directory
ExecStart = /bin/sh -c '/opt/jplima/bin/osswrapper Program Command Line |& (
trap "" 15 && exec install-directory/jplima/bin/rotatelog -n 8#2 log output
directory#3 10240K) '
Type = simple
Restart=no
User=root
TimeoutStopSec=Termination timeout period
LimitNOFILE=65536#4
Environment=SIGDUMP_PATH=-#4
Environment=IMA_OSSWRAPPER_RESTART_INTERVAL=interval-at-which-OSS-wrapper-re
starts-processes#5
[Install]
WantedBy=multi-user.target graphical.target

```

#1

For details about OSS corresponding to add-on administration function, see *3.15 Monitoring function by JPI/IM - Agent* in the *JPI/Integrated Management 3 - Manager Overview and System Design Guide*.

#2

Specify "100" only for unit definition file of `Fluentd`.

#3

The log-destination directory that is setup as the default value varies depending on the program. For the path of the default value, see *List of files/directories that can be viewed/edited by the user in JPI/IM - Agent of integrated agent host (Linux)* in *Appendix A.4(4) Integrated agent host (Linux)* in the *JPI/Integrated Management 3 - Manager Overview and System Design Guide*.

#4

Described only for unit definition file of `Fluentd`.

#5

Specifies in hours the value of the environment-variable `IMA_OSSWRAPPER_RESTART_INTERVAL` (*interval-at-which-OSS-wrapper-restarts-processes*).

Allowed values are.: 0... 2160 (90 days). The default value is 0.

OSS does not restart processing in the following cases:

- When this environment variable is not set

- When 0 is specified as the value of this environment variable
- Cannot convert the specified value to an integer value
- When a value outside the specifiable range is specified

Restarts OSS process when the default-value or specified-value period elapses, starting immediately before OSS process is started.

## Description

This is a definition file for registering programs in systemctl in the Linux environment.

## File

- For a physical host  
`jpc_program-name.service`  
`jpc_program-name.service.model` (model file)
- For a logical host  
`jpc_program-name_logical-host-name.service`

## Storage directory

### ■Integrated agent host

- For a physical host (Model File storage destination)  
`/opt/jplima/conf/`
- For Physical host and Logical host (storage destination of definition file)  
`/usr/lib/systemd/system/`

The target of the installation is as follows:

| Target name       | Description                                     |
|-------------------|-------------------------------------------------|
| multi-user.target | runlevel=3<br>Multi-user mode (text login)      |
| graphical.target  | runlevel=5<br>Multi-user mode (graphical login) |

## Character code

UTF-8 (without BOM)

## Line feed code

LF

## When the definitions are applied

It is reflected when you run the systemctl daemon-reload command.

## Information that is specified

The startup order of the services on which the Prometheus server, Alertmanager, and Exporter depend is shown below.

- For Prometheus server

| Startup order of dependent services | Description        |
|-------------------------------------|--------------------|
| local-fs.target                     | Local File System  |
| remote-fs.target                    | Remote File System |
| rsyslog.service                     | rsyslog            |

- For Exporter, and Alertmanager, Fluentd, imagent, imagentproxy, imagentaction

| Startup order of dependent services | Description        |
|-------------------------------------|--------------------|
| local-fs.target                     | Local File System  |
| remote-fs.target                    | Remote File System |
| rsyslog.service                     | rsyslog            |
| network.target                      | Network            |

The ending timeout period is shown below.

| Types of programs               | End timeout period (in seconds) |
|---------------------------------|---------------------------------|
| Prometheus server               | 110                             |
| Alertmanager                    | 60                              |
| Node exporter                   |                                 |
| Blackbox exporter               |                                 |
| Yet another cloudwatch exporter |                                 |
| process_exporter                |                                 |
| promitor_scraper                |                                 |
| promitor_resource_discovery     |                                 |
| script_exporter                 |                                 |
| Fluentd                         |                                 |
| OracleDB exporter               |                                 |
| VMware exporter                 |                                 |
| imagent                         | 140                             |
| imagentproxy                    | 60                              |
| imagentaction                   |                                 |

The following are the areas that you can change:

- If you want to change command line options

Edit ExecStart line.

■For Prometheus server

For the parameters of `prometheus` command, see the description of *prometheus command options* in [Service definition file \(jpc\\_program-name\\_service.xml\)](#).

■For Alertmanager

For the parameters of `alertmanager` command, see the description of *alertmanager command options* in [Service definition file \(jpc\\_program-name\\_service.xml\)](#).

■For Node exporter

For the parameters of the `node_exporter` command, see the description of *node\_exporter command options*.

■For Yet another cloudwatch exporter

For the parameters of the `yet-another-cloudwatch-exporter` command, see the description of *yet-another-cloudwatch-exporter command options*.

■For Process exporter

For the parameters of the `process_exporter` command, see the description of *process\_exporter command options* in *Process exporter configuration file (jpc\_process\_exporter.yml)*.

■For Primitor

No specifiable options for the `promitor_scraper` command and `promitor_resource_discovery` command.

■For Script exporter

For the parameters of the `script_exporter` command, see the description of *script\_exporter command options* in *Service definition file (jpc\_program-name\_service.xml)*.

■For OracleDB exporter

For the parameters of the `oracledb_exporter` command, see the description of *oracledb\_exporter command options* in *Service definition file (jpc\_program-name\_service.xml)*.

■VMware exporter

For the parameters of the `vmware_exporter` command, see the description of *vmware\_exporter command options* in *Service definition file (jpc\_program-name\_service.xml)*.

- To change the number of log sectors  
Edit the value after the `-n` option on the `ExecStart` line. The number of log sectors that can be specified is 8 to 512.
- To change log size  
Edit the value at the end of the `ExecStart` line.
- If you want to change the log output destination  
Edit the log output directory specified by the `rotatelogs` argument.
- If you want the process to be restarted automatically when it stops abnormally, specify "always" for Restart. If the process is not restarted automatically, such as in a cluster configuration, specify "no" for Restart.

The options for the `node_exporter` command and the `yet-another-cloudwatch-exporter` command are shown below.

- `node_exporter` command options

Items related to collectors can be enabled with the "`--collector.collector name`" flag. To invalidate entries for collectors, specify the "`--no-collector.collector name`" flag.

| Item                                                     | Description                                                                                                                                                                                                            | Changeability | What You Setup in Your JP1/IM - Agent                                                   | JP1/IM - Agent Defaults Value                                |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------|
| <code>--collector.cpu.info</code>                        | Enable the collection of <code>node_cpu_info</code> metrics.<br>Specify the <code>--collector.cpu.info</code> if you want to enable it.<br>Specify the <code>--no-collector.cpu.info</code> if you want to disable it. | Y             | --                                                                                      | <code>--collector.cpu.info</code>                            |
| <code>--collector.filesystem.ignored-mount-points</code> | Specifies the regular expression for mount points to ignore in the <code>FileSystem</code> collector.                                                                                                                  | Y             | Regular expressions for mount points to ignore in the <code>FileSystem</code> collector | <code>--collector.filesystem.ignored-mount-points="^/</code> |

| Item                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Chang<br>eability | What You Setup in<br>Your JP1/IM - Agent                                         | JP1/IM - Agent<br>Defaults Value                                                                                                                                                                                                                                                                                                                                                            |

## ◆ Windows exporter configuration file (jpc\_windows\_exporter.yml)

### Format

Write in YAML format.

```
collectors:
  enabled: cache,cpu,logical_disk,memory,net,system,cs,process,service#
collector:
  logical_disk:
    volume-whitelist: ".+"
    volume-blacklist: ""
  net:
    nic-whitelist: ".+"
    nic-blacklist: ""
  process:
    process-whitelist: ""
    process-blacklist: ""
  service:#
    services-where: "Name=''"
scrape:
  timeout-margin: 0.5
```

#

Parameters for service monitoring that are set in the model file by JP1/IM - Agent 13-01 or later installer.

If you want to use the service monitoring feature by upgrading from JP1/IM - Agent 13-00 to 13-01 or later, you can manually set and edit the service monitoring parameters. For details, see the instructions for configuring service monitoring in *1.21.2(5)(b) Modify metric to Collect (optional)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

### File

jpc\_windows\_exporter.yml

jpc\_windows\_exporter.yml.model (model file)

### Storage directory

#### ■ Integrated agent host

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

### Description

This is a configuration file that specifies the operation of Windows exporter.

### Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

It will take effect when you restart Windows exporter.

## Information that is specified

| Item       |                  | Description                                                                                                                                                                            | Changeability                                                                                    | What You Setup in Your JP1/IM - Agent                          | JP1/IM - Agent Defaults Value                                                                                                                                                                                                                                |

## ◆ Windows exporter (Hyper-V monitoring) configuration file (jpc\_windows\_exporter\_hyperv.yml)

### Format

Write in YAML format.

```
collectors:
  enabled: cs, hyperv
collector:
  net:
    nic-whitelist: ".+"
    nic-blacklist: ""
scrape:
  timeout-margin: 0.5
```

### File

jpc\_windows\_exporter\_hyperv.yml

jpc\_windows\_exporter\_hyperv.yml.model (model file)

## Storage destination directory

- Integrated agent host

- For a physical host  
*Agent-path\conf\*

## Description

This file defines the operation of Windows exporter (Hyper-V monitoring).

## Character code

UTF-8 (without BOM)

## Line feed code

For Windows: CR+LF

For Linux: LF

## Time of import of definitions

It is reflected when you restart Windows exporter (Hyper-V monitor).

## ◆ Process exporter configuration file (jpc\_process\_exporter.yml)

### Syntax

Written in YAML format.

```
process_names:
  - name: "{{.ExeBase}};{{.Username}};{{.Matches.cmdline}}"
    cmdline:
      - (?P<cmdline>.*)
```

### File

jpc\_process\_exporter.yml

jpc\_process\_exporter.yml.model (model file)

### Storage directory

For Windows

When using a physical host

*Agent-path*\conf\

When using a logical host

*shared-folder*\jplima\conf\

For Linux

When using a physical host

/opt/jplima/conf/

When using a logical host

*shared-directory*/jplima/conf/

### Description

The configuration file that determines the behavior of Process exporter.

### Character encoding

UTF-8 (without BOM)

### Linefeed code

In Windows: CR+LF

In Linux: LF

### Timing in which definitions are reflected

When Process exporter is restarted.

## Content description

| Item#         |            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Modifiable | Content set by the user in JP1/IM - Agent                                                               | Default value in JP1/IM - Agent                 |

## ◆ Blackbox exporter configuration file (jpc\_blackbox\_exporter.yml)

### Format

Write in YAML format.

```
modules:
  http:
    prober: http
    http:
      method: GET
      compression: ""
      follow_redirects: true
      fail_if_ssl: false
      fail_if_not_ssl: false
      preferred_ip_protocol: ip4
      ip_protocol_fallback: false
      body: ""
      tls_config:
        insecure_skip_verify: true
  icmp:
    prober: icmp
    icmp:
      preferred_ip_protocol: ip4
      ip_protocol_fallback: false
```

### File

jpc\_blackbox\_exporter.yml

jpc\_blackbox\_exporter.yml.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

### ■Integrated manager host (model File only)

*/opt/jplpccspkg/jpl\_pc\_agent\_probe/jpl\_pc\_agent\_probe\_windows\_JP1/IM - Agent-version-number-(VRRSS-format)/blackbox\_exporter/conf/*  
*/opt/jplpccspkg/jpl\_pc\_agent\_probe/jpl\_pc\_agent\_probe\_linux\_JP1/IM - Agent-version-number-(VRRSS-format)/blackbox\_exporter/conf/*

### ■Monitoring agent host

In Windows:

- For a physical host  
*Install the monitoring agent directory\jplpccs\conf\*
- For a logical host  
*shared-directory\jplpccs\conf\*

In Linux:

- For a physical host  
*Install the monitoring agent directory/jplpccs/conf/*
- For a logical host  
*shared-directory/jplpccs/conf/*

## Description

A configuration file that specifies the operation of the Blackbox exporter.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflected when the Blackbox exporter is restarted or when the Blackbox exporter reload API is executed.

## Information that is specified

For definitions of common placeholders used in the table below, see [About definition of common placeholders for descriptive items in yml file](#).

| Item    |                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Ch<br>ang<br>eab<br>ility | What You Setup in<br>Your JP1/IM - Agent                                   | JP1/IM - Agent<br>Defaults Value                                                                                                                                                                                              |

      statistics:
        - Sum
```

### File

jpc\_ya\_cloudwatch\_exporter.yml

jpc\_ya\_cloudwatch\_exporter.yml.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

### ■Integrated manager host (model File only)

*/opt/jplpccspkg/jpl\_pc\_agent\_cloud/jpl\_pc\_agent\_cloud\_linux\_JPI/IM-Agent-version-number-(VRRSS-format)/ya\_cloudwatch\_exporter/conf/*

### ■Monitoring agent host

- For a physical host  
*Install the monitoring agent directory/jplpccs/conf/*
- For a logical host  
*shared-directory/jplpccs/conf/*

## Description

A configuration file that specifies the behavior of Yet another cloudwatch exporter.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When you restart Yet another cloudwatch exporter, it will be reflected in the behavior of Yet another cloudwatch exporter.

Also, when you execute the `jddcreatetree` command and the `jddupdatetree` command after performing the above operation, it is reflected in the displayed contents of the tree in the integrated operation viewer.

## Information that is specified

- Top-level parameters  
The discovery listed in the following table is listed.

| Item      | Description                                                                         | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value |

## ◆ Promitor Scraper configuration file (metrics-declaration.yaml)

### Syntax

Written in YAML format.

```
version: v1
azureMetadata:
  tenantId: tenant-ID
  subscriptionId: subscription-ID
  resourceGroupName: resource-group-name
metricDefaults:
  aggregation:
    interval: 00:05:00
  scraping:
    schedule: "0 * * ? * *"
metrics:
  - name: azure_virtual_machine_disk_read_bytes_total
    description: "Bytes read from disk during monitoring period."
    scraping:
      schedule: "0 * * ? * *"
    azureMetricConfiguration:
      metricName: Disk Read Bytes
      aggregation:
        type: Total
      resourceDiscoveryGroups:
        - name: virtual-machine-group
```

### File

metrics-declaration.yaml

metrics-declaration.yaml.model (model file)

### Storage directory

For Windows

When using a physical host

*Agent-path*\conf\promitor\scraper\

When using a logical host

*shared-folder*\jplima\conf\promitor\scraper\

For Linux

When using a physical host

/opt/jplima/conf/promitor/scraper/

When using a logical host

*shared-directory*/jplima/conf/promitor/scraper/

### Description

The configuration file that defines the metrics to be acquired by the Promitor Scraper.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected in Promitor Scraper behavior when restarting Promitor Scraper.

After performing the action above, definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

| Item#              | Description                                                                                                                                                                                                     | Modifiable | Content set by the user in JP1/IM - Agent | Default value in JP1/IM - Agent |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------------------------------|---------------------------------|
| version            | Version of declaration that is used. Allowed values are v1.                                                                                                                                                     | N          | --                                        | v1                              |
| azureMetadata:     | Azure information                                                                                                                                                                                               | --         | --                                        | --                              |
| tenantId:          | The id of the Azure tenant that will be queried.                                                                                                                                                                | REQ        | Tenant ID                                 | None                            |
| subscriptionId:    | The id of the default subscription to query.                                                                                                                                                                    | REQ        | Subscription ID                           | None                            |
| resourceGroupName: | The name of the default resource group to query.                                                                                                                                                                | REQ        | Resource group name                       | None                            |
| [cloud:]           | The name of the Azure cloud to use. Options are Global (default), China, UsGov & Germany.                                                                                                                       | Y          | --                                        | None                            |
| metricDefaults:    | Metric default settings                                                                                                                                                                                         | --         | --                                        | --                              |
| aggregation:       | Aggregation settings                                                                                                                                                                                            | Y          | --                                        | --                              |
| [interval]:        | The default interval which defines over what period measurements of a metric should be aggregated. a cron that fits your needs.<br>Set this parameter to a value greater than or equal to 5 minutes (00:05:00). | Y          | --                                        | 00:05:00                        |
| [limit]:           | The default maximum amount of resources to scrape when using dimensions or filters.<br>If omitted, this is specified as 10000.                                                                                  | Y          | --                                        | None                            |
| labels:            | The default labels that will be applied to all metrics.                                                                                                                                                         | --         | --                                        | --                              |
| <key>: <value>     | Specify the key and value in a character string of 1 to 255 characters.<br>The key value must be specified with characters that match the regular expression <code>[a-z_][a-z0-9_]*</code> .                    | Y          | --                                        | None                            |

## ◆ Promitor Scraper runtime configuration file (runtime.yaml)

### Syntax

Written in YAML format.

```
authentication:
  mode: ServicePrincipal
  identityId: client-ID
server:
  httpPort: 20719
metricSinks:
  prometheusScrapingEndpoint:
    enableMetricTimestamps: true
    baseUriPath: /metrics
metricsConfiguration:
  absolutePath: installation-directory/jplpccs/conf/promitor/scraper/metric
```

```
s-declaration.yaml
resourceDiscovery:
  host: installation-host-name
  enabled: true
  port: 20720
```

## File

runtime.yaml

runtime.yaml.model (model file)

## Storage directory

For Windows

When using a physical host

*Agent-path*\conf\promitor\scraper\

When using a logical host

*shared-folder*\jplima\conf\promitor\scraper\

For Linux

When using a physical host

/opt/jplima/conf/promitor/scraper/

When using a logical host

*shared-directory*/jplima/conf/promitor/scraper/

## Description

The configuration file that defines Promitor Scraper authentication information, ports used for scraping, and other information.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected in Promitor Scraper behavior when restarting Promitor Scraper.

After performing the action above, definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

| Item#                         | Description                                                                                                                                                                                                                                                              | Modifiable | Content set by the user in JP1/IM - Agent | Default value in JP1/IM - Agent                                               |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------------------------------|-------------------------------------------------------------------------------|
| authentication:               | Authentication for Azure                                                                                                                                                                                                                                                 | --         | --                                        | --                                                                            |
| [mode:]                       | Defines authentication mode to use. Options are ServicePrincipal, SystemAssignedManagedIdentity, If Promitor is on Azure, specifying SystemAssignedManagedIdentity or UserAssignedManagedIdentity is recommended. If Promitor is not on Azure, specify ServicePrincipal. | REQ        | --                                        | ServicePrincipal                                                              |
| [identityId:]                 | Id of the Azure AD entity to authenticate with when integrating with Microsoft Azure. Required when using ServicePrincipal.                                                                                                                                              | REQ        | --                                        | None                                                                          |
| [server:]                     | server settings                                                                                                                                                                                                                                                          | --         | --                                        | --                                                                            |
| [httpPort:]                   | Defines the port to serve HTTP traffic<br>If omitted, this is specified as 80.<br>If you start Promitor on a physical host and a logical host or on more than one logical host, set a different port number for each host.                                               | Y          | --                                        | 20719                                                                         |
| [metricSinks:]                | Metric Configuration                                                                                                                                                                                                                                                     | --         | --                                        | --                                                                            |
| [prometheusScrapingEndpoint:] | Prometheus settings                                                                                                                                                                                                                                                      | --         | --                                        | --                                                                            |
| [enableMetricTimestamps:]     | Defines whether or not a timestamp should be included when the value was scraped on Azure Monitor. Supported values are True to opt-in & False to opt-out.                                                                                                               | N          | --                                        | true                                                                          |
| baseUriPath:                  | Controls the path where the scraping endpoint for Prometheus is being exposed.                                                                                                                                                                                           | N          | --                                        | /metrics                                                                      |

## ◆ Promitor Resource Discovery configuration file (resource-discovery-declaration.yaml)

### Syntax

Written in YAML format.

```
version: v1
azureLandscape:
  tenantId: tenant-ID
  subscriptions:
    - subscription-ID
resourceDiscoveryGroups:
  - name: virtual-machine-group
    type: VirtualMachine
  - name: function-app-group
    type: FunctionApp
```

### File

resource-discovery-declaration.yaml

resource-discovery-declaration.yaml.model (model file)

### Storage directory

For Windows

When using a physical host

*Agent-path*\conf\promitor\resource-discovery\

When using a logical host

*shared-folder*\jplima\conf\promitor\resource-discovery\

For Linux

When using a physical host

/opt/jplima/conf/promitor/resource-discovery/

When using a logical host

*shared-directory*/jplima/conf/promitor/resource-discovery/

### Description

The configuration file that defines the resource group to be acquired by Promitor Resource Discovery.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected in Promitor Resource Discovery behavior when restarting Promitor Resource Discovery.

After performing the action above, definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## Content description

| Item#                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Modifiable | Content set by the user in JP1/IM - Agent | Default value in JP1/IM - Agent                   |

## ◆ Promitor Resource Discovery runtime configuration file (runtime.yaml)

### Syntax

Written in YAML format.

```
authentication:
  mode: ServicePrincipal
  identityId: client-ID
server:
  httpPort: 20720
```

### File

runtime.yaml

runtime.yaml.model (model file)

## Storage directory

For Windows

When using a physical host

*Agent-path*\conf\promitor\resource-discovery\

When using a logical host

*shared-folder*\jplima\conf\promitor\resource-discovery\

For Linux

When using a physical host

/opt/jplima/conf/promitor/resource-discovery/

When using a logical host

*shared-directory*/jplima/conf/promitor/resource-discovery/

## Description

The configuration file that defines Promitor Resource Discovery authentication information, ports used for scraping, and other information.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected in Promitor Resource Discovery behavior when restarting Promitor Resource Discovery.

After performing the action above, definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed.

## ◆ Script exporter configuration file (jpc\_script\_exporter.yml)

### Syntax

Written in YAML format.

```
scripts:
  - name: run_scriptA
    command: ./examples/scriptA.sh
    timeout:
      max_timeout: 120
  - name: run_scriptB
    command: ./examples/scriptB.sh
    args:
      - arg1
      - arg2
```

### File

jpc\_script\_exporter.yml

jpc\_script\_exporter.yml.model (model file)

### Storage directory

For Windows

When using a physical host

*Agent-path*\conf\

When using a logical host

`shared-folder\jplima\conf\`

For Linux

When using a physical host

`/opt/jplima/conf/`

When using a logical host

`shared-directory/jplima/conf/`

## Description

The configuration file that determines the behavior of Script exporter.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows: CR+LF

In Linux: LF

## Timing in which definitions are reflected

When Script exporter is restarted.

## ◆ Web exporter configuration file (jpc\_web\_exporter.yml)

### Format

Write in YAML format.

```
common:
  username: user name
  domainname: domain name
  tracenum: generations
```

### File

jpc\_web\_exporter.yml

jpc\_web\_exporter.yml.model (model file)

### Storage directory

#### ■ Integrated agent host

- For a physical host  
*Agent-path*\conf\

## Description

This is a configuration file that specifies the operation of Web exporter.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## When the definitions are applied

It will take effect when you restart Web exporter.

## Information that is specified

## ◆ Playwright configuration file (jpc\_playwright.config.ts)

### Format

```
import { defineConfig, devices } from '../lib/playwright/node_modules/@playwright/test';

export default defineConfig({
  name: 'test_1',
  testDir: '../lib/playwright/tests',
```

```

    fullyParallel: false,
    :
(Abbreviated)
    :
    use: {
        deviceScaleFactor: 1,
        acceptDownloads: false,
        ignoreHTTPSErrors: false,
        :
(Abbreviated)
        :
    },

    projects: [
        {
            name: 'project_1',
            testMatch: /\.*/ ,
            use: {
                trace: {
                    mode: 'on',
                    attachments: false,
                    screenshots: true,
                    snapshots: false,
                    sources: false,
                },
            },
        },
    ],
}));

```

## File

jpc\_playwright.config.ts

jpc\_playwright.config.ts.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host (definition files and model files)  
*Agent-path\conf\*
- For a logical host (definition file)  
*shared-folder\jplima\conf\*

## Description

This is a configuration file that defines the operation of Playwright.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## When the definitions are applied

When Web scenarios are executed by the Web exporter, they are reflected in Playwright operation.

## Information that is specified

| Item            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Changeability | What You Setup in Your JP1/IM - Agent                                                                                                                                                                                                                                                         | JP1/IM - Agent Defaults Value |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| name            | <p>Specifies the name of the entire test.</p> <p>The specified name is stored in the trace file path name.</p> <p>If you specify both this parameter-name of globals-and projects, name in projects takes precedence.</p> <p>If you omit both this parameter (global name) and the name in projects, it is an anonymous test and the name of the test is not used in the trace file path name.</p> <p>Notes: Name in projects are parameters that specify the names of the individual tests.</p> | Y             | <p>Specifies the name of the entire test.</p> <p>Specify so that the number of characters in the folder name where the trace file is stored is 255 full-pitch or half-pitch characters or less.</p> <p>One full-pitch character and one half-pitch character are calculated respectively.</p> | test_1                        |
| testDir         | Specify the folder to call the test file.                                                                                                                                                                                                                                                                                                                                                                                                                                                        | N             | --                                                                                                                                                                                                                                                                                            | testDir                       |
| fullyParallel   | You can configure entire test run to concurrently execute all tests in all files using this option.                                                                                                                                                                                                                                                                                                                                                                                              | N             | --                                                                                                                                                                                                                                                                                            | false                         |

|      | trace       | <p>Whether to record trace for each test.</p> <p>The trace contents can also be checked in the trace viewer.</p> <p>For each attachment, screenshot, snapshot, or source file item, you can turn output on or off for the output setting of the trace.</p> <p>This parameter configures the trace-output settings for all Web scenarios. However, for Web scenarios in which individual values are specified in trace in projects parameters, tracing is performed based on the settings. Therefore, if you want to change the trace output setting related to the Web scenario specified in testMatch in the projects parameter, you must edit trace in the same projects parameter. Initially, all Web scenarios are set to be included in project_1.</p> <p>Also note that if you run the "log in" Web scenario, the password is printed in clear text in the trace file. Even if the trace file is output in resource folder, it can be turned off by snapshots setting. However, since files outside resource folder are output regardless of trace setting, you need to manage them yourself.</p> | Y             | --                                                                                                                                                                                                                                                                                                                                                                         | --                            |

|      | testMatch |      | Specify a string and a regular expression for the file to be executed in the test file.<br>The settings you make in projects apply only to Web scenario file that you specify in testMatch parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Y             | Specify Web scenario file for which you want to run the tests according to the settings that you specified in projects.<br>When specifying a character string, specify it with up to 255 double-byte or single-byte alphanumeric characters. You must specify only the filename without including the filepath.                                                     | ./*/                          |
|      | use       |      | You can handle the same settings as use parameters at the top level.<br>Use of globals is the setting for all tests, whereas use in projects can be set separately for each test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Y             | --                                                                                                                                                                                                                                                                                                                                                                  | --                            |
|      | trace     |      | Specify whether traces are logged for each test run.<br>The trace contents can also be checked in the trace viewer.<br>For each attachment, screenshot, snapshot, or source file item, you can turn output on or off for the output setting of the trace.<br>This parameter sets the tracing for Web scenario specified in testMatch. Initially, all Web scenarios are set to be included in project_1, so if testMatch is default state and you want change the trace output setting, you should change this parameter.<br>Also note that if you run the "log in" Web scenario, the password is printed in clear text in the trace file. Even if the trace file is output in resource folder, it can be turned off by snapshots setting. However, since files outside resource folder are output regardless of trace setting, you need to manage them yourself. | Y             | --                                                                                                                                                                                                                                                                                                                                                                  | --                            |
|      |           | mode | Specify whether traces are logged for each test run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Y             | You can specify one of the following: <ul style="list-style-type: none"> <li>on<br/>Always record traces.</li> <li>off<br/>Traces are not always recorded.</li> <li>retain-on-failure<br/>Trace is always recorded, but only when the test failed.</li> <li>retain-on-first-failure<br/>Record only at first run of each test and do not record retries.</li> </ul> | on                            |

## ◆ VMware exporter configuration file (jpc\_vmware\_exporter.yml)

### Format

Write in YAML format.

```
default:
  vsphere_host: "xxx.xxx.xxx.xxx"
  vsphere_user: "user"
  ignore_ssl: False
  specs_size: 5000
  fetch_custom_attributes: False
  fetch_tags: False
  fetch_alarms: False
  collect_only:
    vms: True
    vmguests: True
    datastores: True
    hosts: True
    snapshots: False
```

## File

jpc\_vmware\_exporter.yml

jpc\_vmware\_exporter.yml.model (model file)

## Storage directory

### ■Integrated agent host

For Windows

- When using a physical host

*Agent-path*\conf\

For Linux

- When using a physical host

/opt/jplima/conf/

## Description

This is a configuration file that specifies the operation of VMware exporter.

### Important

The section-name "default" is subject to presence checking and should not be deleted or modified.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

It will take effect when you restart VMware exporter.

## Information that is specified

## ◆ SQL exporter configuration file (jpc\_sql\_exporter.yml)

### Format

Write in YAML format.

```
global:
  scrape_timeout: 10s
  scrape_timeout_offset: 500ms
  min_interval: 0s
  max_connections: 3
  max_idle_connections: 3
  max_connection_lifetime: 5m
  JP1IMADIR: installation-path-for-JP1/IM-Agent

jobs:
  - job_name: Monitored hostname#1
    collectors: [mssql_*]
    static_configs:
      - targets:#2
          monitored-connection-information 1#2
          monitored-connection-information 2#2
          :

collector_files:
  - "../conf/mssql_*.collector.yml"
```

<sup>#1</sup>

Specifies that the hostname of Microsoft SQL Server to be monitored is unique.

#2

The targets can contain more than one monitored connection-information in the following format: Each monitored instance is specified to be unique.

*Monitored-instance-name: 'sqlserver: //login-username@monitored-hostname: monitored-port-number'*

## File

jpc\_sql\_exporter.yml

## Storage destination directory

- Integrated agent host

- For a physical host

*Windows-versions-of-SQL-exporter-archived-file#-are-extracted-to\sql\_exporter\_windows\jplima\conf\*

*#*

*Agent-path\options\sql\_exporter\_windows\_VVRRSS.zip*

## Description

A configuration file that defines the operation of SQL exporter.

## Character code

UTF-8 (without BOM)

## Line feed code

CR+LF

## Time of import of definitions

This is applied when SQL exporter is restarted.

## Description

| Item name              | Description                                                                                                                                                                                                                                                                               | Changeability | What You Set Up with JP1/IM - Agent                                          | JP1/IM - Agent Defaults |

## ◆ Sample file of Script exporter configuration file for SAP system monitoring (jpc\_script\_exporter\_sap.yml)

### Format

This example is provided as sample to monitor SAP in the following conditions.

- Conditions

<Common the SAP system log extract commands>

- The prerequisites described in *3.15.5 SAP system monitoring function* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide* are met.
- The path relative to the working folder specified in the Script exporter service definition file, and the environment parameters file is stored in the following folder.

```
../conf/user/
```

- IM management node categories  
Enterprise
- Specify a max\_timeout value that is less than the Prometheus server scrape interval. Since the value of the max\_timeout is set to 30, change the value of max\_timeout if the Prometheus server scrape interval is less than or equal to 30.

<jr3slget command>

- Output system log information of SAP instance "o246bci\_SD5\_00".
- The following information was specified in the environmental parameters file (jr3slget.ini) when the command was executed to extract system log information:
  - RFC access information
  - Target information
  - Log file to which the system log information is output
  - Command working directory

- The timestamp file is stored in the jr3slget folder below the working folder specified in the environment parameters file.
- Label name of IM management node: SAP Syslog extractor(jr3slget)

<jr3alget command>

- Specify "SAP CCMS Monitor Templates" for the monitor set name and "Entire System" for the monitor name to print CCMS alert message.
- The following information is specified in the environment parameters file (jr3alget.ini) when extracting CCMS alert information by executing the command.
  - RFC access information
  - Target information
  - Log file to which CCMS alerting information is output
  - Command working directory
- The timestamp file is stored in the jr3slget folder below the working folder specified in the environment parameters file.
- Label name of IM management node: SAP CCMS Alert extractor(jr3alget)

- Definition example

```
scripts:
  - name: SAP Syslog extractor(jr3slget)
    command: jr3slget-command-path
    args:
      - "-lasttime"
      - "sltimestamp.txt"
      - "-x2"
      - "-cnf"
      - "../conf/user/jr3slget.ini"
    timeout:
      max_timeout: 30
      enforced: true

  - name: SAP CCMS Alert extractor(jr3alget)
    command: jr3alget-command-path
    args:
      - "-lasttime"
      - "altimestamp.txt"
      - "-x2"
      - "-cnf"
      - "../conf/user/jr3alget.ini"
    timeout:
      max_timeout: 30
      enforced: true
```

## File

jpc\_script\_exporter\_sap.yml

## Storage directory

- Integrated agent host

In Windows:

- For a physical host  
`Agent-path\conf\sample\`

In Linux:

- For a physical host  
`/opt/jplima/conf/sample/`

## Description

This configuration file defines Script exporter operation for SAP system monitoring. Copy the sample file (`jpc_script_exporter_sap.yml`), change the file name of the destination to "`jpc_script_exporter.yml`", and place it in the placement destination of the Script exporter configuration file (`jpc_script_exporter.yml`). For the location of the files, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

## Character code

See to the explanation of *Character encoding* in *Script exporter configuration file (`jpc_script_exporter.yml`)*.

## Line feed code

See the explanation of *Line feed code* in *Script exporter configuration file (`jpc_script_exporter.yml`)*.

## When the definitions are applied

See the explanation of *When the definitions are applied* in *Script exporter configuration file (`jpc_script_exporter.yml`)*.

## Information that is specified

See the explanation of *Information that is specified* in *Script exporter configuration file (`jpc_script_exporter.yml`)*.

When you define a script in Script exporter configuration file that executes the SAP system log extract command, `script.name` must include the SAP system log extract command name (`jr3slget`, or `jr3alget`) to be executed. Otherwise, an IM management node for the metric output function of SAP system monitoring is created under Other Applications category.

When you create multiple environment parameters file that differ in parameter settings, such as when defining multiple RFC destinations (multiple instance), you define multiple scripts as shown in the following example definition.

```
scripts:
  - name: SAP Syslog extractor(jr3slget)_A
    command: C:/Program Files (x86)/Hitachi/jplpc/agtm/evtrap/jr3slget.exe
    args:
      - "-lasttime"
      - "sltimestamp_A.txt"
      - "-x2"
      - "-cnf"
      - "../conf/user/jr3slget_A.ini"
    timeout:
      max_timeout: 30
      enforced: true

  - name: SAP CCMS Alert extractor(jr3alget)_A
```

```

command: C:/Program Files (x86)/Hitachi/jplpc/agtm/evtrap/jr3alget.exe
args:
  - "-lasttime"
  - "altimestamp_A.txt"
  - "-x2"
  - "-cnf"
  - "../conf/user/jr3alget_A.ini"
timeout:
  max_timeout: 30
  enforced: true

- name: SAP Syslog extractor(jr3slget)_B
  command: C:/Program Files (x86)/Hitachi/jplpc/agtm/evtrap/jr3slget.exe
  args:
    - "-lasttime"
    - "../data/script_exporter/jr3slget/sltimestamp_B.txt"
    - "-x2"
    - "-cnf"
    - "../conf/user/jr3slget_B.ini"
  timeout:
    max_timeout: 30
    enforced: true

- name: SAP CCMS Alert extractor(jr3alget)_B
  command: C:/Program Files (x86)/Hitachi/jplpc/agtm/evtrap/jr3alget.exe
  args:
    - "-lasttime"
    - "altimestamp_B.txt"
    - "-x2"
    - "-cnf"
    - "../conf/user/jr3alget_B.ini"
  timeout:
    max_timeout: 30
    enforced: true

```

## ◆ Log monitoring common definition file (jpc\_fluentd\_common.conf)

### Format

```

@include jpc_fluentd_common_wevt_rendered.conf (Windows only)
@include jpc_fluentd_common_list.conf

## [System Settings]
<system>
  log_level log-level
  format text
  time_format %Y-%m-%d %H:%M:%S %z

## File

jpc\_fluentd\_common.conf

jpc\_fluentd\_common.conf.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

In Linux:

- For a physical host  
/opt/jplima/conf/
- For a logical host  
*shared-directory*/jplima/conf/

## Description

A File for defining Common behavior in log monitoring function, such as HTTP POST request function and log output function.

Lines that begin with a "#" are treated as Comment and do not affect programming behavior.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

This information is reflected in Fluentd operation when Fluentd service is Restart.

## Information that is specified

<worker> Directive

By specifying the ID of the worker that Fluentd starts as an argument, the plug-in specified in the directive will be operated only on the worker with the specified ID.

*worker id* (optional)

Specifies the ID of the worker that Fluentd will start. Serves as an argument to the worker N-M directive. N always specifies 1. The value specified for M specifies the integer specified for the number of workers minus one.

[System Settings] Section

Performs a Setup that affects the operation of the entire log monitoring function.

### Log Level (optional)

Specifies the log level for Fluentd.

| Description                                                                                                                                                                                                                                                                            | Changeability  | What You Setup in Your JP1/IM - Agent             | JP1/IM - Agent Defaults Value |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------------------------------------------|-------------------------------|
| The following log levels can be specified in ascending order of redundancy: <ul style="list-style-type: none"><li>fatal</li><li>error</li><li>warn</li><li>info</li><li>debug</li><li>trace</li></ul> Default is "info". Fluentd outputs info, warn, error, and fatal logs in default. | Can be changed | Setup it according to the logs you want to check. | info                          |

*number-of-workers* (optional)

| Description                                                                                      | Changeability  | What You Setup in Your JP1/IM - Agent                                        | JP1/IM - Agent Defaults Value |
|--------------------------------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------|-------------------------------|
| Specifies the number of workers that Fluentd will start. Valid values are integers from 1 to 31. | Can be changed | Specify the total number of log monitoring common definition files, text log | 10                            |

| Description | Changeability | What You Setup in Your JP1/IM - Agent                                                                              | JP1/IM - Agent Defaults Value |
|-------------|---------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------|
|             |               | file monitoring definition files, Windows event log monitoring definition files, and log metrics definition files. |                               |

## [Output Settings] Section

Executes setup for outputting the log data monitored by log monitoring function.

If you are using the data delivery function to multiple manager hosts, additionally describe the secondary JP1/IM agent control base configuration. For setting examples, see *Sample configuration for log monitoring common definition file (jpc\_fluentd\_common.conf)* in 3.15.7(5)(f) *Send settings for programs other than JP1/IM agent control base* in the *JP1/Integrated Management 3-Manager Overview and System Design Guide*.

### JP1/IM agent control base's JP1 event-translation API (optional)

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Changeability  | What You Setup in Your JP1/IM - Agent                                                                                                                                                 | JP1/IM - Agent Defaults Value                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <p>Specifies the endpoint for HTTP request, up to 512 bytes. If you use HTTPS, use https prefix.</p> <p>&lt;Sample Setup&gt;</p> <pre># Use HTTP endpoint http://example.com/api # Use HTTPS. You can set additional HTTPS parameters like tls_xxx endpoint https://example.com/api</pre> <p>This parameter supports placeholders, so you can embed time, tags, and record fields. The &lt;buffer&gt; section is also required for the placeholders to work.</p> <p>&lt;Sample Setup&gt;</p> <pre>endpoint http://example.com/api/\${tag}-\${key} &lt;buffer tag,key&gt; # buffer parameters &lt;/buffer&gt;</pre> <p>Specifies the destination of the log data and metric in endpoint. For details, see (9) <i>HTTP POST request function (http plug-in)</i> of 3.15.3 <i>Log monitoring function by JP1/IM - Agent</i> in the <i>JP1/Integrated Management 3 - Manager Overview and System Design Guide</i>.</p> <p>If URL specified in endpoint is incorrect, Warning Message is issued and no metric or log data is sent. Therefore, after Fluentd starts, you must ensure that no Warnings appear in the log at POST of metric and log data.</p> | Setup Required | Specifies JP1 event translation API's URL for JP1/IM agent control base to issue JP1 events. If you have changed the Port number of JP1/IM agent control base, you must change Setup. | <code>http://integrated-agent-host-name:20726/ima/api/v1/proxy/service/imdd/im/api_system/v1/events/transform</code> |

### Flush interval (optional)

| Description                                                                                                                                                                                                   | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------|-------------------------------|
| <p>Specify how often to send log data stored in buffer to JP1/IM agent control base.</p> <p>Value that you can specify is 1s to 86,400s. The unit (s) is required. It also works without a specification.</p> | Yes           | Change the sending intervals.         | 60s                           |

## How output Plug-In Works When the Buffer Queue Is Full (optional)

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Changeability | What You Setup in Your JP1/IM - Agent                            | JP1/IM - Agent Defaults Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------|-------------------------------|
| Determines how output plug-in behaves when buffer queue is full. The following Values can be specified: <ul style="list-style-type: none"><li>throw_exception<br/>Prints Error to Fluentd logs. Even if a new log is output to the log File to be monitored, it is not added to the buffers. When the transmission is successful, the log output to the log File is trapped, but if it is wrapped and deleted, it is lost.</li><li>drop_oldest_chunk<br/>Delete the oldest chunk to accept the new chunk.</li></ul> | Yes           | Determines how output plug-in behaves when buffer queue is full. | throw_exception               |

## Retry interval (optional)

| Description                                                                                                                                                                                                                                                                                                               | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------|-------------------------------|
| Specifies the retry interval for chunks that have failed to be sent. Value that you can specify is 1s to 600s. The unit (s) is required. If Value is specified for this parameter in a blank or invalid format, the retry interval is about 2 seconds in Winsows environment and about 0.02 seconds in Linux environment. | Yes           | Specify the retry interval.           | 10s                           |

## Buffer size limit (optional)

| Description                                                                                                                                                                                                                                                                                                                                                                                                                             | Changeability | What You Setup in Your JP1/IM - Agent                           | JP1/IM - Agent Defaults Value |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------------------------------------------------------------|-------------------------------|
| Specifies the size limit for the instance of the buffer plugin. Possible values are 32MB~65536MB. If the total size of the buffers stored reaches this threshold, all add operations fail with an error and data is lost. The buffer uses the amount of disk space in the environment where JP1/IM - Agent is set up. The total size of the buffer is estimated by the following formula.<br>"0.015MB * Number of JP1 events to buffer" | Yes           | Specifies the size limit for the instance of the buffer plugin. | 4096MB                        |

### [Remote Write Settings] Section

Fluentd performs a Setup to send sample to Trend data Management Database of JP1/IM - Manager.

If you are using the data delivery function to multiple manager hosts, additionally describe the secondary JP1/IM agent control base configuration. For setting examples, see *Sample configuration for log monitoring common definition file (jpc\_fluentd\_common.conf)* in 3.15.7(5)(f) *Send settings for programs other than JP1/IM agent control base* in the *JP1/Integrated Management 3-Manager Overview and System Design Guide*.

## JP1/IM agent control base Trend Data Write API (optional)

| Description                                                                                                                                                                                                                                                               | Changeability  | What You Setup in Your JP1/IM - Agent                                                                                                                                                            | JP1/IM - Agent Defaults Value                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Specifies the endpoint for HTTP request, up to 512 bytes. If you use HTTPS, use https prefix.<br><Sample Setup><br># Use HTTP<br>endpoint http://example.com/api<br># Use HTTPS. You can set additional HTTPS parameters like tls_xxx<br>endpoint https://example.com/api | Setup Required | Specifies URL of the trend data write API for JP1/IM agent control base to send metric to JP1/IM - Manager. If you have changed Port number of JP1/IM agent control base, you must change Setup. | http://integrated-agent-host-name:20727/ima/api/v1/proxy/service/promscale/write |

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Changeability | What You Setup in Your JP1/IM - Agent | JP1/IM - Agent Defaults Value |

## ◆ Log monitoring target definition file (jpc\_fluentd\_common\_list.conf)

### Format

```

## [Target Settings]
@include monitor-definition-file-name
...

```

### File

jpc\_fluentd\_common\_list.conf

jpc\_fluentd\_common\_list.conf.model (model file)

### Storage directory

#### ■ Integrated agent host

In Windows:

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

In Linux:

- For a physical host  
/opt/jplima/conf/
- For a logical host  
*shared-directory*/jplima/conf/

### Description

A File that specifies what to monitor for logging. Specifies File of text-formatted monitoring log file definition file, or monitoring Windows event-log definition file. The monitoring logging of the specified monitoring definition File is set to Enable.

In the default Setup, the logging monitoring for all "monitoring text-formatted log file definition file" and "monitoring Windows event-log definition file" under conf/user directory is Enable, as defined below.

#### - Default Setup

```
## [Target Settings]
@include user/fluentsd_*_tail.conf
@include user/fluentsd_*_wevt.conf (Windows only)
```

Lines that begin with a "#" are treated as Comment and do not affect programming behavior. If you want to perform an operation that temporarily stops log monitoring for some monitor definition File, enumerate the monitor definition File and Comment out the monitor definition File row that you want to stop log monitoring.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

This information is reflected in Fluentd operation when Fluentd service is restart.

## Information that is specified

[Target Settings] Section

Setup the monitor-definition File that you use in fluentd.

### Monitor Definition File Name (optional)

By specifying File of definition file for monitoring text-formatted log file or definition file for monitoring Windows event-log, the logging monitoring of the specified monitor-definition File is set to Enable. The asterisk (\*) in the monitor-definition File represents a wildcard (arbitrary character string). The only wildcard you can specify is "\*".

If this option is omitted, log monitoring is not performed.

It is not case sensitive in Windows. It is case sensitive in Linux.

You can specify the monitor definition file up to 1016 in Windows and up to 508 in Linux.

## Example definition

In the following example, the fluentsd\_abcd\_tail.conf and fluentsd\_abcd\_wevt.conf monitoring definitions File have Setup of Enable, and Setup of the fluentsd\_efgh\_tail monitoring definition File is disabled.

```
## [Target Settings]
@include fluentsd_abcd_tail.conf
#@include fluentsd_efgh_tail.conf
@include fluentsd_abcd_wevt.conf
```

## ◆ Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)

### Format

```
<worker 0>
## [Metric Settings]

## File

fluentd\_@@trapname@@\_tail.conf.template

fluentd\_@@trapname@@\_tail.conf.template.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

In Linux:

- For a physical host  
/opt/jplima/conf/
- For a logical host  
*shared-directory*/jplima/conf/

## Description

Definition File for monitoring text-formatted logging File.

Copy the template (fluentd\_@@trapname@@\_tail.conf.template) and change file name of Copy destination to fluentd\_log-monitoring-name\_tail.conf for use. File name must be unique within integrated agent host. For details on the location of fluentd\_log-monitoring-name\_tail.conf, see *Appendix A.4(3) Integrated*

*agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*. *log-monitoring-name* must be between 1 and 30 characters long. Allowed characters are single-byte alphanumeric characters, "-" (hyphen), and "\_" (underscore).

Create a monitor-definition file for each wrapped-around log file group that you want to monitor (or for each log file that does not wrap-around). JP1/IM - Agent creates a IM managed node for SID of target of monitoring according to the value specified in *IM-management-node-label-name* of the IM managed node in the monitoring definition file. If another monitoring definition file has the same *IM-management-node-label-name*, only one IM management node is created.

The text-based log file monitoring feature reads this definition file and analyzes the log that the application has written to the text-based log file. You can setup if you specify a condition for the analyzed information and the condition is met, the information to be converted to JP1 events or output to Fluentd logging file. For details about JP1 event to be issued, see [3.2.3\(2\) JP1 event issued that monitoring a textual log File](#).

Lines beginning with "#" are treated as Comment and do not affect the programming behavior.

The default definition in [Forward Settings] section is set to transform log data to JP1 event and transfer to JP1/IM - Manager when *SEVERITY* is worse than *Warning*.

When transforming log data to JP1 event and transferring it to JP1/IM - Manager, set *SEVERITY* so that its severity is equal or worse than *Warning*.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

This information is reflected in Fluentd operation when Fluentd service is restart.

If add or delete of definition files or value in [Metric Settings] section is changed, the change is reflected in tree view of the Integrated Operation Viewer window.

For details about application method, see *1.21.2(19) Creation and import of IM management node tree data (for Windows) (mandatory)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Information that is specified

<worker> directive

See the description of <worker> directive in [Log monitoring common definition file \(jpc\\_fluentd\\_common.conf\)](#).

*worker-id* (optional)

| Description                                                                                                                                          | Changeability  | What You Setup in Your JP1/IM - Agent                                                                                        | JP1/IM - Agent Defaults Value |
|------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| Specifies the number of workers that Fluentd will start. Serves as an argument to the <worker N> directive. Valid values are integers from 1 to 128. | Can be changed | It must be specified so as not to duplicate the worker ID specified in the existing text log file monitoring definition file | 1                             |

| Description | Changeability | What You Setup in Your JP1/IM - Agent                | JP1/IM - Agent Defaults Value |
|-------------|---------------|------------------------------------------------------|-------------------------------|
|             |               | or the Windows event log monitoring definition file. |                               |

#### [Metric Settings] section

Setup Value of label of sample that you want to send to JP1/IM - Manager's Trend data Management Database.

##### *log-monitoring-name* (mandatory)

Specifies *log-monitoring-name* specified in the file name of copy destination as a string of 1 to 30 characters. Allowed characters are single-byte alphanumeric characters, "-" (hyphen), and "\_" (underscore). The default value is "@@trapname@@".

Because you need to setup several locations in the file, use OS command/editor function to replace the "@@trapname@" location with *log-monitoring-name* you want to specify.

If the specification is omitted, error occurs when Fluentd is started.

Note that *log-monitoring-name* must be setup as follows:

- All *log-monitoring-name* in the same file are the same.
- *log-monitoring-name* is unique for the monitoring text-formatted log file definition file and the Windows event log monitoring definition file

##### *host-name* (optional)

Specify the host name to be monitored using characters 1 to 255 other than control characters. The default value is setup by integrated agent installers.

If the specification is omitted, IM management node is not created.

You can also dynamically setup the canonical host name of the system by doing the following:

```
instance ${Socket.gethostname}
```

##### *IM-management-node-label-name* (optional)

Specifies the character string that integrated operation viewer displays on IM management node label. This is not a control character. When URL is encoded, the character string must be between 1 and 234 bytes (the upper limit for multibyte characters is 26). The default value is "Application".

If the specified information is invalid or omitted, IM management node is not going to be created.

You can specify the same IM management node label name in different monitoring definition files. Then, only one IM management node is created, and JP1 events in both of monitor-defined files are Add to one IM management node.

##### *category-ID* (optional)

Specifies the category ID of IM management node corresponding to SID to be monitored for logging as a character 1 to 255 other than control characters. If the specification is omitted, "otherApplications" is assumed.

#### [Input Settings] section

Setup the path to the text-formatted log File that you want to monitor and the regular expressions that parse the log Message.

##### *log-monitoring-name* (mandatory)

Same as the section [Metric Settings] description.

### *monitored-paths* (required)

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Changeability         | What You Setup in Your JP1/IM - Agent | Default Value for JP1/IM - Agent |

| <p>Specify the path to read. You can specify multiple paths by separated by commas.</p> <p>You can include * and strftime formats to dynamically add and delete the logging file you want to monitor. The list of log files is updated at <code>refresh_interval</code> intervals.</p> <p>For specification examples, see (3) <i>Text-format log file monitoring facility (tail plug-in)</i> in 3.15.3 <i>Log monitoring function by JP1/IM - Agent</i> in the <i>JP1/Integrated Management 3 - Manager Overview and System Design Guide</i>.</p> <p>If you specify an incorrect path, Log Files logging is not read.</p> <p>The following rules apply to programming:</p> <ul style="list-style-type: none"><li>• Specify as an absolute path</li><li>• Directories and File on network drives cannot be specified (for Windows)</li><li>• Specify "/" instead of "\" as the path delimiter (in Windows)</li><li>• Multiple paths can be specified.</li><li>• You can specify "*" (wildcard).</li><li>• You specify within 256 bytes.</li><li>• The following path names cannot be specified.<ul style="list-style-type: none"><li>- File with a leading "-" (hyphen)</li><li>- Folder name, directory name, or File name containing environment-dependent characters</li><li>- Space-directory-name (for Linux)</li></ul></li></ul> | Installation Required | Specifies Log Files path.             | Not applicable                   |

### *read-the-logs-to-be-monitored-when-Fluentd-is-started-for-the-first-time-from-the-beginning* (optional)

| Description                                                                                                                                                                                                              | Changeability  | What You Setup in Your JP1/IM - Agent                                                       | Default Value for JP1/IM - Agent |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------------------------------------------------------------------------------------|----------------------------------|
| <p>Specifies whether the log should start reading from the beginning, not the end, or from the last read position recorded in <code>pos_file</code>.</p> <p>You can specify <code>true</code> or <code>false</code>.</p> | Can be changed | If you want to read a log that was already Add at startup, change it to <code>true</code> . | false                            |

### *Fluentd-character-code* (optional)

If *character-codes-of-monitored-logs* is UTF-8 or C (handled as Comment), specify the default setup (handled as Comment). Specify UTF-8 if *character-codes-of-monitored-logs* is not UTF-8 nor C (handled as Comment). In the default Setup, since "#" is specified at the beginning of the line and it is handled as Comment, "#" is turned Delete.

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Changeability  | What You Setup in Your JP1/IM - Agent                                                                           | Default Value for JP1/IM - Agent                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <p>Specifies the encoding in which to read the line.</p> <p>By JP1/IM - Agent, <code>in_tail</code> outputs value of string in ASCII-8BIT encoding in default.</p> <p>You can change it with the following options:</p> <ul style="list-style-type: none"><li>• <code>encoding</code> changes the text to <code>encoding</code>.</li><li>• If both <code>encoding</code> and <code>from_encoding</code> are specified, <code>in_tail</code> attempts to convert the <code>jj</code>, string to a <code>encoding</code>.</li></ul> | Can be changed | In JP1/IM - Agent, you can specify the following Value: <ul style="list-style-type: none"><li>• UTF-8</li></ul> | Not specified (Comment out)<br>#<br><code>encoding "UTF-8"</code> |

### *character-codes-of-monitored-logs* (optional)

If *character-codes-of-monitored-logs* is UTF-8 or C, specify the default setup (handled as comment). If *character-codes-of-monitored-logs* is not UTF-8 nor C, specify the character code. In the default setup, since "#" is specified at the beginning of the line and it is handled as comment, "#" is turned delete.

| Description                                                      | Changeability  | What You Setup in Your JP1/IM - Agent                                                                                                                                                                                                     | Default Value for JP1/IM - Agent                         |
|------------------------------------------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| See the explanation of <i>Fluentd-character-code</i> (optional). | Can be changed | Specifies the character encoding of log files.<br>In JP1/IM - Agent, you can specify the following value: <ul style="list-style-type: none"><li>UTF-16LE</li><li>UTF-16BE</li><li>Shift_JIS</li><li>Windows-31J</li><li>GB18030</li></ul> | Not specified (Comment out)<br># encoding<br>"Shift_JIS" |

### *enable-additional-watch-timers*

| Description                                                                                                                                                                                                                                                                                                                                                                                       | Changeability  | What You Setup in Your JP1/IM - Agent                                        | Default Value for JP1/IM - Agent |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------|----------------------------------|
| Specify true or false.<br>If false is specified for this parameter, the most recent log is not monitored when reading multiple lines of log. Therefore, if multiline is specified as the type of the parse plug-in, true is specified.<br>Specifying false for this parameter significantly reduces CPU and I/O consumption when tailing a large number of files on systems that support inotify. | Can be changed | Specify true only if multiline is specified as the type of the parse plugin. | false                            |

### *flush-interval-for-multiline-logs*

| Item Name                | Description                                                                                                                                                                                                                                                                                                 | Changeability | JP1/IM - What the user sets on the agent              | JP1/IM - Initial value of Agent |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------|---------------------------------|
| multiline_flush_interval | Specify multiline_flush_interval item as flush interval for multiline logs.<br>If this item is not specified, the latest log is not monitored when multiline logs are monitored.<br>Therefore, when type of parsing plugin is set multiline, set it as following:<br><div>multiline_flush_interval 5s</div> | Changeable    | Set 5s only when type of parsing plugin is multiline. | 5s                              |

### *log-format*

Specifies the format for parsing the imported log.

The following formats can be specified:

| type           | Description                                                                           |
|----------------|---------------------------------------------------------------------------------------|
| none (Default) | Read a one-line log as it is without parsing or structuring.                          |
| regex          | Reads a single-line log that matches the pattern specified by the regular expression. |
| multiline      | Loads a multi-line log that matches the pattern specified by the regular expression.  |
| syslog         | Read the log output by syslog.                                                        |

| type | Description                                         |
|------|-----------------------------------------------------|
| csv  | Load logs in CSV format (comma delimited).          |
| tsv  | Loads logs in TSV format (tab-delimited).           |
| ltsv | Import logs in LTSV format (labeled tab-delimited). |

For examples of specifying logs in each format, see *3.15.3(3)(g) Log parsing function (parse plug-in)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### *settings-depending-on-the-log-format*

Specify the entries according to the *log-format*.

- If none

```
<parse>
  @type none
  message_key message
  time_key time
  null_empty_string false
  estimate_current_event true
  keep_time_key false
</parse>
```

- If regexp

```
<parse>
  @type regexp
  expression regular-expressions-to-parse-logs
  time_key time
  null_empty_string false
  estimate_current_event true
  keep_time_key false
  items-for-parsing-date-and-time-of-logs
</parse>
```

#### *regular-expression-to-parse-log* (required)

When using the Named Capture feature to trim character strings, one of names is necessary to be "message". If character strings named "message" is not trimmed, MESSAGE of JP1 event will be empty.

Specifies a regular expression and parses the contents of one line of the log. Use the Named Capture feature to trim a string named "message" that Setup to Message of JP1 event. For example: The default Value contains a regular expression that trims the entire line in "message". You can also trim with another name and Setup to any property of JP1 event.

#### *items-for-parsing-date-and-time-of-logs*

When a Date/time in the logging Message is trimmed as the name "time", it is set as value of JPC\_LOG\_TIME of JP1 event. When you trim a Date/time in the logging Message as the name "time", it is necessary to define the items for parsing date and time of logs. When you do not trim a Date/time, or define the items for parsing date and time of logs are not defined, the value of JPC\_LOG\_TIME will be Date/time when Fluentd monitored the log message.

| Item Name  | Description                                                                                                  | Changeability  | What You Setup in Your JP1/IM - Agent        | Default Value for JP1/IM - Agent |
|------------|--------------------------------------------------------------------------------------------------------------|----------------|----------------------------------------------|----------------------------------|
| expression | specifies the regular expressions matches for logging.<br>Regular expressions must be sandwiched between "/" | Can be changed | Setup according to Log Files logging format. | expression /^(?<message>.*)\$/   |

| Item Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Changeability | What You Setup in Your JP1/IM - Agent                                                                                                                                                                                                                                                   | Default Value for JP1/IM - Agent |

  keep_time_key false
  items-for-parsing-date-and-time-of-logs
</parse>
```

*regular-expression-to-parse-the-first-line-log* (required)

Specify a regular expression to parse the contents of one log line. If the specified regular expression matches the contents of the log, the matched log line is read as the first line of a multi-line log.

*regular-expression-to-parse-logs* (required)

Similar to the description in "For regexp". *N* can be an integer from 1 to 20, and the specified regular expression is used to parse the contents of a multi-line log as line *N*.

*items-for-parsing-date-and-time-of-logs*

Same as description of "If regexp".

| <code>format_firstline</code> | Specify the first line of the log as a regular expression.<br>The multiline parse plug-in parses multi-line logs. If <code>multiline</code> is specified as the type of the parse plug-in, <code>formatN</code> and <code>format_firstline</code> must be specified.<br>The maximum number of bytes that can be specified in a regular expression is 1023 bytes (excluding delimiters). Regular expressions must be sandwiched between "/" (delimiters). If the delimiter is not used, an error is output.           | Changeable    | Specify the first line of the log as a regular expression according to the format of the log file to be monitored. | --                              |
| <code>formatN</code>          | Specify each line of the log as a regular expression.<br>Specifies the format of the multiline log. <i>N</i> is an integer from 1 to 20 that creates a list of regular expression formats.<br>The maximum number of bytes that can be specified in a regular expression is 1023 bytes (excluding delimiters). Regular expressions must be sandwiched between "/" (delimiters). If the delimiter is not used, an error is output.<br>If this parameter is not specified, an error is printed when Fluentd is invoked. | Changeable    | Specify each line of the log as a regular expression according to the format of the log file to be monitored.      | --                              |

(Legend) -: Not applicable

- For syslog

```
<parse>
  @type syslog
```

```

time_type string
time_format date-and-time-formats
rfc5424_time_format syslog-date-and-time-format-in-RFC-5424-format
message_format types-of-syslogs
with_priority priority-prefix
parser_type string
support_colonless_ident presence-or-absence-of-ident-field
time_key time
null_empty_string false
estimate_current_event true
keep_time_key false
localtime true
utc false
</parse>

```

#### *date-and-time-formats* (required)

Same as description of "If regexp". Specify a regular expression to parse the date and time in the log message. If `auto` is specified as *types-of-syslogs*, specify *syslog-date-and-time-format-in-RFC-3164-format*.

#### *syslog-date-and-time-format-in-RFC-3164-format* (optional)

Specify a regular expression to parse the date and time of the syslog in RFC-5424 format. Use this parameter only if *types-of-syslogs* is specified to `auto`.

#### *types-of-syslogs* (required)

Specify the type of syslog to be analyzed: `rfc3164` (RFC-3164 format), `rfc5424` (RFC-5424 format), or `auto` (both).

#### *priority-prefix* (required)

Indicates whether RFC-3164 formatted syslogs contain a priority prefix as `true` or `false`. `false` can be specified only when `rfc3164` is specified as *types-of-syslogs*, otherwise it must be specified as `true`.

#### *presence-or-absence-of-ident-field* (required)

Specifies whether the RFC-3164-formatted syslog contains the IDENT field as `true` or `false`. `false` can be specified only when `rfc3164` is specified as *types-of-syslogs*, otherwise it must be specified as `true`.

| Item Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         | Changeability | JP1/IM - What the user sets on the agent                                                                 | JP1/IM - Initial value of Agent |

- For csv

```
<parse>
  @type csv
  keys array-of-field-names-for-records
  delimiter ,
  parser_type types-of-internal-parsers
  time_key time
  null_empty_string false
  estimate_current_event true
  keep_time_key false
  items-for-parsing-date-and-time-of-logs
</parse>
```

*array-of-field-names-for-records* (required)

Specifies the field names of the record in the form of an array. One of field names is necessary to be "message" in order to set to MESSAGE of JP1 event. If character strings named "message" is not trimmed, MESSAGE of JP1 event will be empty.

*types-of-internal-parsers* (required)

Specifies the type of internal parser that parses logs in CSV format.

| Item Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Changeability | JP1/IM - What the user sets on the agent                                                                                                                                                                                                                                                                                                                                        | JP1/IM - Initial value of Agent |

| keys        | Specify an array of record item names within 256 bytes.<br>If this parameter is not specified, or if an incorrect value is specified, no error or warning message is printed and the monitored log is parsed in the wrong format. Therefore, after starting Fluentd and adding logs, it is necessary to check whether JP1 events are issued in a normal format.                                                                                                                                                                                                                                                                                                                                                           | Changeable    | Specify according to the format of the log file to be monitored.                                                                                                                                                                                                                                                                                                                | --                              |
| parser_type | Specifies the type of internal parser for parsing log lines, either normal or fast.<br>If normal is specified, the Ruby CSV.parse_line method is used.<br>If fast is specified, Fluentd's own lightweight implementation is used. The parser you use is several times faster than usual, but supports only typical patterns. The following formats are supported:<br># non-quoted<br>value1,value2,value3,value4,value5<br># quoted<br>"value1","value2","value3","value4",""<br># escaped<br>"message","message","message","message",""<br># mixed<br>message,"message","message","message",""<br>If this parameter is not specified, or if an incorrect value is specified, an error is output when Fluentd is started. | Changeable    | If the format of the log file to be monitored is in the following format, specify fast.<br># non-quoted<br>value1,value2,value3,value4,value5<br># quoted<br>"value1","value2","value3","value4",""<br># escaped<br>"message","message","message","message",""<br># mixed<br>message,"message","message","message",""<br>If the format of the log file to be monitored does not | --                              |

| Item Name | Description | Changeability | JP1/IM - What the user sets on the agent     | JP1/IM - Initial value of Agent |
|-----------|-------------|---------------|----------------------------------------------|---------------------------------|
|           |             |               | match the above format, normal is specified. |                                 |

(Legend) -: Not applicable

*items-for-parsing-date-and-time-of-logs*

Same as description of "If regexp". Specify when array of field names for records has "time".

- For tsv

```
<parse>
  @type tsv
  keys array-of-field-names-for-records
  delimiter "\t"
  time_key time
  null_empty_string false
  estimate_current_event true
  keep_time_key false
  items-for-parsing-date-and-time-of-logs
</parse>
```

*array-of-field-names-for-records* (required)

Specifies the field names of the record in the form of an array.

| Item Name | Description                                                                                                                                                                                                                                                                                                                                                     | Changeability | JP1/IM - What the user sets on the agent                         | JP1/IM - Initial value of Agent |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------|---------------------------------|
| keys      | Specify an array of record item names within 256 bytes.<br>If this parameter is not specified, or if an incorrect value is specified, no error or warning message is printed and the monitored log is parsed in the wrong format. Therefore, after starting Fluentd and adding logs, it is necessary to check whether JP1 events are issued in a normal format. | Changeable    | Specify according to the format of the log file to be monitored. | --                              |

(Legend) -: Not applicable

*items-for-parsing-date-and-time-of-logs*

Same as description of "If regexp". Specify when array of field names for records has "time".

- For ltsv

```
<parse>
  @type ltsv
  delimiter-between-items delimiter-pattern-between-items
  label_delimiter delimiter-between-label-and-value
  time_key time
  null_empty_string false
  estimate_current_event true
  keep_time_key false
  items-for-parsing-date-and-time-of-logs
</parse>
```

*delimiter-between-items delimiter-pattern-between-items* (required)

Specifies the delimiter between items. Specify one of the following:

- When the separator between items is a tab

```
delimiter "\t"
```

- When the separator between items is one or more blanks

```
delimiter_pattern /\s+/"
```

*delimiter-between-label-and-value* (required)

Specifies the delimiter between the label and the value.

| Item Name         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Changeability | JP1/IM - What the user sets on the agent                         | JP1/IM - Initial value of Agent |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------|---------------------------------|
| delimiter         | Specifies the delimiter between items. The only delimiter that can be specified is double-quoted "\t".<br><br>If either this parameter or <code>delimiter_pattern</code> is specified, or if an incorrect value is specified, no error or warning message is printed and the monitored log is parsed in the wrong format. Therefore, after starting Fluentd and adding logs, it is necessary to check whether JP1 events are issued in a normal format.                                               | Changeable    | Specify according to the format of the log file to be monitored. | --                              |
| delimiter_pattern | In an LTSV format file, this is specified when the separator between entries is one or more spaces. The only delimiter that can be specified is "/\s+"/.<br><br>If either this parameter or <code>delimiter</code> is not specified, or if an incorrect value is specified, no error or warning message is output, and the monitored log is parsed in the wrong format. Therefore, after starting Fluentd and adding logs, it is necessary to check whether JP1 events are issued in a normal format. | Changeable    | Specify according to the format of the log file to be monitored. | --                              |
| label_delimiter   | Specifies the delimiter between the label and the value within 256 bytes.<br><br>If this parameter is not specified, or if an incorrect value is specified, no error or warning message is printed and the monitored log is parsed in the wrong format. Therefore, after starting Fluentd and adding logs, it is necessary to check whether JP1 events are issued in a normal format.                                                                                                                 | Changeable    | Specify according to the format of the log file to be monitored. | --                              |

(Legend) -: Not applicable

*items-for-parsing-date-and-time-of-logs*

Same as description of "If regexp". Specify when array of field names for records has "time".

[Attributes Settings] section

Setup Attributes of JP1 events to be issued and Attribute value.

*log-monitoring-name* (mandatory)

Same as description of [Metric Settings] section.

*event-ID* (optional)

Specifies Value to Setup for B. ID property of JP1 event. For details about Value that can be specified, see JP1/Base Operation Manual. The default Value is "00007601" (Event ID used for monitoring text-formatted log file definition file).

If this option is omitted, JP1 events are not issued.

Instead of specifying "ID *event-ID*", you can setup *event ID* according to the value of message property by specifying:

```
ID "${
  if record['message'].match(/regex-1/)
```

```

        'event-ID1'
    elsif record['message'].match(/regex-2/)
        'event-ID2'
    elsif record['message'].match(/regex-3/)
        'event-ID3'
    ...
    else
        'event-ID4'
    end}"

```

The conditional branch of Ruby determines value of message property and turns setup event ID. In the above cases, if *regex-1* is matched, *event ID* is set to the value as specified in *event-ID-1*. If it doesn't match, it will setup *event-ID-2* if it matches *regex-2*. If none of the matches are compared by the number specified in elsif, else statement setup value specified in *event-ID-4*. to *event ID*. You can specify a maximum of 100 if and elsif statements.

#### *host-name* (optional)

Same as description of [Metric Settings] section.

If the specification is omitted, the attribute value of JP1\_SOURCEHOST is not setup and JP1 event is not add to the correct IM management node.

You can also dynamically setup the canonical host name of the system by doing the following:

```
JP1_SOURCEHOST ${Socket.gethostname}
```

#### *severity* (optional)

Specifies the value to setup for E.SEVERITY property of JP1 event. For details about the value that can be specified, see the *JP1/Base User's Guide*. The default value is "Notice".

If this option is omitted, JP1 events are not issued.

Instead of specifying "SEVERITY *severity*", you can setup the severity according to the value of message property by specifying:

```

SEVERITY "${
    if record['message'].match(/regex-1/)
        'Critical'
    elsif record['message'].match(/regex-2/)
        'Error'
    elsif record['message'].match(/regex-3/)
        'Warning'
    ...
    else
        'Notice'
    end}"

```

The conditional branch of Ruby determines value of message property and turns setup *severity*. In the above cases, "Critical" is setup to *severity* if the *regex-1* is matched. If it doesn't match, it will setup "Error" if it matches against *regex-2*. Setup "Notice" in else construct to *severity* if elsif matches none of the specified numbers. You can specify up to 100 statements of if and elsif.

#### *IM-management-node-label-name* (optional)

Same as description of [Metric Settings] section.

If this option is omitted, JP1 events are not issued.

#### *any-attribute-name any-value* (optional)

Specify this operand if you want to Add a JP1 event-attribute. For details about Attribute name that can be specified, see JP1/Base Operation Manual.

For Value, you can specify the captured name in the [Input Settings] section with the regular expressions to parse the logs.

For example, to capture with the name "NUMBER" and Setup to the property EXIT\_CODE, you would specify:

```
EXIT_CODE ${record['NUMBER']}
```

You can Add more than one extended attribute, but no JP1 event is issued if the sum of the sizes of Value that Setup the extended attribute of JP1 event exceeds the limit.

For details about the upper limit of extended attributes, see [4.4.4\(5\) \\_\\_transformEvent method](#).

#### [Inclusion Settings] section

Specifies the conditions of the log to be monitored in a regular expression. If not specified, all logs are monitored. If an unmonitored log is output, the log is not converted to a JP1 event and is not output to Fluentd log.

In the default Setup, "#" is specified at the beginning of the line and is handled as Comment, so when specifying it, "#" is going to be deleted.

*log-monitoring-name* (mandatory)

Same as description of [Metric Settings] section.

*attribute-name-of-JP1-event* (optional)

Specifies the attribute name of JP1 event. For example, "MESSAGE". If the specification is omitted, error occurs when Fluentd is started.

*regular-expression-of-logs-to-monitor* (optional)

Specifies a regular expression for the value of the attribute specified by the attribute name of JP1 event. If the value to be match is included, monitoring is performed.

If the specification is omitted, error occurs when Fluentd is started.

You can also specify a logical AND or OR condition for multiple regular expression patterns. For details about how to specify the log data, see [3.15.3\(7\) Log data extractor \(grep plug-in\)](#) in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### [Exclusion Settings] section

Specifies the conditions for logs that are not monitored, in regular expressions. If not specified, all logs are monitored. In the default Setup, "#" is specified at the beginning of the line and is handled as Comment, so when specifying it, "#" is going to be deleted.

*log-monitoring-name* (mandatory)

Same as description of [Metric Settings] section.

*attribute-name-of-JP1-event* (optional)

Specifies the attribute name of JP1 event. For example, "MESSAGE".

If the specification is omitted, error occurs when Fluentd is started.

*regular-expression-of-logs-to-monitor* (optional)

Specifies a regular expression for the value of the attribute specified by *attribute-name-of-JP1-event*. If value to be match is included, monitoring is not performed.

If the specification is omitted, error occurs when Fluentd is started.

You can also specify a logical AND or OR condition for multiple regular expression patterns. For details about how to specify the log data, see [3.15.3\(7\) Log data extractor \(grep plug-in\)](#) in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### [Forward Settings] section

Setup the regular expression of the log data to be converted into a JP1 event.

*log-monitoring-name* (mandatory)

Same as description of [Metric Settings] section.

*attribute-name-of-JP1-event* (optional)

Specifies the attribute name of JP1 event. The default value is "SEVERITY".

If the specification is omitted, error occurs when Fluentd is started.

*regular-expression-for-logs-that-emit-JP1-events* (optional)

Specifies the condition for regular expressions that issue JP1 events for the value of the attribute specified by *attribute-name-of-JP1-event*.

The default value is "Warning|Error|Critical|Alert|Emergency" and matches if the value of SEVERITY is greater than or equal to Warning.

If Value of the attribute contains a Value that Match the condition, the monitored log content is converted to JP1 events and Add to JP1/Base in Integrated manager host. The content of the monitored log is also output to Fluentd log. If you do not Match the condition, JP1 event is not issued and only logged in Fluentd.

If the specification is omitted, Error occurs when Fluentd is started.

In the [Attributes Settings] section, "Notice" is specified as the default SEVERITY. Therefore, the log monitoring result is not output as a JP1 event. It is output only in Fluentd log.

If you want to publish a log with a SEVERITY of "Notice" as a JP1 event, change the definition as shown in the underlined part:

```
pattern /Notice|Warning|Error|Critical|Alert|Emergency/
```

## Example definition

The following is an example of the condition and definitions for monitoring a textual logging File.

### ■Conditions

- Path of the logged file to monitor

C:\Program Files (x86)\Hitachi\HNTRLib2\spool\\*

- Logging message

```
6027 2022/08/25 17:45:50.219      jbsessionmgr      000018EC 00000FCC KAVA14
97-I          jpladmin user has Login
```

- Log messages to monitor

Monitor the logging message where message ID starts with KAVA.

- Value to setup to MESSAGE

Setup message ID or later text in the logging message.

- Value to setup to SEVERITY

Setup value according to severity of message ID.

- Value to setup to any attribute name

Setup the process-name (jbsessionmgr) contained in the log message to attribute name PROCESS\_NAME.

## File

fluentd\_@@trapname@@\_wevt.conf.template

fluentd\_@@trapname@@\_wevt.conf.template.model (model file)

## Storage directory

### ■Integrated agent host

- For a physical host (Definition file and model file)  
*Agent-path*\conf\
- For a logical host (Definition file)  
*shared-folder*\jplima\conf\

## Description

Definition file for monitoring Windows event logs.

Copy the template (`fluentd_@@trapname@@_wevt.conf.template`) and change file designation of Copy destination to `fluentd_log-monitoring-name_wevt.conf` to use it. For details on the location of `fluentd_log-monitoring-name_wevt.conf`, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*. File name must be unique within the monitoring agent host. The characters that can be used for `log-monitoring-name` are alphanumeric characters, hyphens, and underscores, and the length of the character string is 1 to 30 characters. Create this file for each application you want to monitor.

JP1/IM - Agent creates a IM managed node for setup SID of monitoring target according to value specified in `IM-management-node-label-name` in the monitoring definition file. If `IM-management-node-label-name` is the same even if it is another monitoring definition file, only one IM management node is created.

Windows Event Log Monitor feature reads this File and analyzes the log information that the application has written to Windows Event Log. If conditions are specified for the analyzed information and the conditions are met, you can Setup the information to be converted to JP1 events or output to Fluentd logging File. For JP1 event to be issued, see *3.2.3(3) JP1 event to be issued by monitoring Windows event log*.

Lines that begin with a "#" are treated as comments and do not affect programming behavior.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

## When the definitions are applied

This information is reflected in Fluentd operation when Fluentd service is Restart.

If add, delete of a definition file, or value in [Metric Settings] section is changed, the change is reflected in tree view of the Integrated Operation Viewer windows.

For details about application method, see *1.21.2(19) Creation and import of IM management node tree data (for Windows) (mandatory)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Information that is specified

<worker> directive

Same as <worker> directive of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

`worker-id` (optional)

| Description                                                                                                                             | Changeability  | What You Setup in Your JP1/IM - Agent                                                                                                   | JP1/IM - Agent Defaults Value |
|-----------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| Same as <code>worker-id</code> of <i>Monitoring text-formatted log file definition file (fluentd_@@trapname@@_tail.conf.template)</i> . | Can be changed | Same as <code>worker-id</code> of <i>Monitoring text-formatted log file definition file (fluentd_@@trapname@@_tail.conf.template)</i> . | 2                             |

[Metric Settings] section

See the description of the [Metric Settings] section in *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

#### [Input Settings] section

Specifies the event log type to monitor.

##### *log-monitoring-name* (mandatory)

Same as *log-monitoring-name* in the [Metric Settings] section of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

##### *log-type* (mandatory)

Specifies the event log type to be monitored as a comma-separated string. It is 256 bytes or less. The default value for JP1/IM - Agent is "application, system".

For details about the log type that can be specified, see 3.15.3(4)(a) *Types of logs that can be monitored* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### [Attributes Settings] section

Setup attributes and attribute value of JP1 events to be issued.

##### *log-monitoring-name* (mandatory)

Same as *log-monitoring-name* in the [Metric Settings] section of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

##### *event-ID* (optional)

Same as the event ID in the [Attributes Settings] section of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

##### *host-name* (optional)

Same as *host-name* in the [Attributes Settings] section of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

##### *IM-management-node-label-name* (optional)

Same as *IM-management-node-label-name* in the [Attributes Settings] section of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

##### *OS-version* (optional)

Specifies the number of the major version for Windows if you want JP1 event to add the attributes of OS\_VERSION. In the default setup, "#" is specified at the beginning of the line, and it is handled as comment, so when specifying it, delete "#".

#### [Inclusion Settings] section

See the description of the [Inclusion Settings] section in *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

#### [Exclusion Settings] section

See the description of the [Exclusion Settings] section in *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

#### [Forward Settings] section

See the description of the [Forward Settings] section in *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

## Example definition

In the following example, monitoring is performed when the log type is "application" and the source is "JP1/IM-Manager", and a JP1 event is issued when the event level is "Warning" or higher.

```
<worker 0>
## [Metric Settings]
```

```

# ◆ Sample file of system log information monitoring definition file for SAP system (fluentd\_sap\_syslog\_tail.conf)

## Format

This is similar to the format of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

A definition example for monitoring system log information of an SAP system using the monitor function of a log file in text format under the following conditions is provided as a sample file.

### - Conditions

- Monitored log file
  - Monitors the log file of the command that extracts the system log information of SAP system.
  - The language setting for the command execution environment is Japanese, and the character encoding is SJIS. If the character code of the log file to be monitored is not SJIS, change the character encoding specified in the from encoding of [Input Settings] (when operating in a Linux environment, it is necessary to change the character code specified to UTF-8).
- Monitoring name
  - It is called "sap\_syslog".
- Example log messages
  - Monitor the logs output in the system log message record with the default layout.
  - The default layout is as follows. For details about the extractable fields and specifications of the command, see *jr3slget*.

```
<TIME><INSTANCE><USER><PROGRAM><MSGNO><MSGTEXT>
```

The following is an example of the log message that is output.

```
13:58:04o246bci_SD5_00      SAPSYS      SAPMSSY1D01 Transaction canceled 0
0 152 ( ) (omitted)
```

# The length of <MSGTEXT> is 255 bytes.

The above log message is structured for each field as follows.

| Fielding ID | Field                             | Value                              |
|-------------|-----------------------------------|------------------------------------|
| <TIME>      | Message recording time            | 13:58:04                           |
| <INSTANCE>  | Server that recorded the message  | o246bci_SD5_00                     |
| <USER>      | User who recorded the message     | SAPSYS                             |
| <PROGRAM>   | Program that recorded the message | SAPMSSY1                           |
| <MSGNO>     | Message number                    | D01                                |
| <MSGTEXT>   | Message text                      | Transaction canceled 00<br>152 ( ) |

- Log messages to monitor
  - Monitor all logs. The message records in the system log are cut out for each field, and each is set as an attribute of the JP1 event. The correspondence between each field and the name when cropped by the regular expression named capture function and the extended attribute of the JP1 event is as follows.

| Field ID   | Name to cut with regular expression | JP1 event attributes | What to set                          |
|------------|-------------------------------------|----------------------|--------------------------------------|
| <TIME>     | sap_time                            | Not specified.       | --                                   |
| <INSTANCE> | instance                            |                      |                                      |
| <USER>     | user                                |                      |                                      |
| <PROGRAM>  | program                             |                      |                                      |
| <MSGNO>    | msgno                               |                      |                                      |
| <MSGTEXT>  | message                             | MESSAGE              | Stores the value of the field as is. |

Legend: -- : Not applicable

- Value to set for SEVERITY  
Set "Notice".
- Log data to convert to JP1 events  
Matches when SEVERITY is greater than or equal to "Warning". Because "Notice" is specified for SEVERITY, JP1 event is not issued and is output only to Fluentd logging.
- Label name of IM management node  
SAP Syslog

## File

fluentd\_sap\_syslog\_tail.conf

## Storage directory

- Integrated agent host

In Windows:

- For a physical host  
`Agent-path\conf\sample\`

In Linux:

- For a physical host  
`/opt/jplima/conf/sample/`

## Description

Sample file of the definition file for monitoring system log information of SAP system.

Copy sample file (`fluentd_sap_syslog_tail.conf`) and change the file name of the copy destination to `fluentd_log_monitor_name_tail.conf` if required. For the location of the files, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*. This definition file is created for each script specified by Script exporter configuration file (`jpc_script_exporter.yml`).

Lines that start with a "#" are treated as comments and do not affect program operation.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When Fluentd service restarts, it is reflected in Fluentd operation.

When a definition file is added or deleted, or the value in the [Metric Settings] section is changed, the changes are reflected in integrated operation viewer tree view.

For details about how to import trees, see *1.21.2(19) Creation and import IM management node tree data (for Windows) (mandatory)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Information that is specified

See the description of *Information that is specified* in *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

If a user wants to use this sample file, the following settings must be changed according to the user environment.

| Setting item                                                            | Initial value        | Setting contents                                                                                                                                                             |
|-------------------------------------------------------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path of the monitored log file                                          | @@sap_logpath@@      | Specify the path of the text file specified by the user in the environment parameters file to output the results of extracting the system log information of the SAP system. |
| SAP instance name from which you want to extract system log information | @@sap_instancename@@ | Specify the name of the SAP instance to output the results of extracting system log information from the SAP system.                                                         |

In addition, JP1 event is issued when a match occurs when SEVERITY is greater than or equal to "Warning". In this sample, SEVERITY is always set to "Notice", so JP1 events are not emitted, but only output to the Fluentd log. When outputting log monitoring results as JP1 events, change the definition as shown in the underlined part below.

```
## [Forward Settings]
<match tail.sap_syslog>
  @type rewrite_tag_filter
  <rule>
    key SEVERITY
    pattern /Notice|Warning|Error|Critical|Alert|Emergency/
    tag ${tag}.jplevent
  </rule>
  <rule>
    key SEVERITY
    pattern /.*/
    tag ${tag}.outputlog
  </rule>
</match>
```

## ◆ Sample file of CCMS alert information monitoring definition file for SAP system (fluentd\_sap\_alertlog\_tail.conf)

### Format

This is similar to the format of *Monitoring text-formatted log file definition file (fluentd\_@@trapname@@\_tail.conf.template)*.

A definition example for monitoring CCMS alert information of an SAP system using the monitor function of a log file in text format under the following conditions is provided as a sample file.

#### - Conditions

- Monitored log file
  - Monitors the log file of the command that extracts CCMS alert information of SAP system.
  - The language setting for the command execution environment is Japanese, and the character encoding is SJIS. If the character code of the log file to be monitored is not SJIS, change the character encoding specified in the from encoding of [Input Settings] (when operating in a Linux environment, it is necessary to change the character code specified to UTF-8).
- Monitoring name
 

It is called "sap\_alertlog".
- Example log messages

Monitor the logs that are printed in CCMS alert record with the default layout.

The default layout is as follows: For details about the extractable fields and specifications of the command, see [jr3alget](#).

```
<ALERT_DATE><ALERT_TIME><MTSYSID><MTMCNAME><OBJECTNAME><FIELDNAME><VALUE><SEVERITY><MSG>
```

The following is an example of the log message that is output.

```
20231219041721NWE          Background          Backgroun
dService          SystemWideFreeBPWP
3          50          0 WPs > 2 WPs the current value exceeds the thres
hold (omitted)
```

# The length of <MSG> is 255 bytes.

The above log message is structured for each field as follows.

| Fielding ID  | Field                    | Value                                                 |
|--------------|--------------------------|-------------------------------------------------------|
| <ALERT_DATE> | Alerting Date (YYYYMMDD) | 20231219                                              |
| <ALERT_TIME> | Alerting time (HHMMSS)   | 041721                                                |
| <MTSYSID>    | Name of SAP system       | NWE                                                   |
| <MTMCNAME>   | Monitor context name     | Background                                            |
| <OBJECTNAME> | Monitor object name      | BackgroundService                                     |
| <FIELDNAME>  | MTE abbreviation         | SystemWideFreeBPWP                                    |
| <VALUE>      | Warning value            | 3                                                     |
| <SEVERITY>   | Severity                 | 50                                                    |
| <MSG>        | Translated messages      | 0 WPs > 2 WPs the current value exceeds the threshold |

- Log messages to monitor

Monitor all logs. Excludes the message records in the system log field by field, and sets the translated message and warning value as the JP1 event message and severity, respectively. The correspondence between each field and the name when cropped by the regular expression named capture function and the extended attribute of the JP1 event is as follows.

| Field ID     | Name to cut with regular expression | JP1 event attributes | What to set                                                                                                                                                |
|--------------|-------------------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ALERT_DATE> | alrtdate                            | Not specified.       | --                                                                                                                                                         |

## File

fluentd\_sap\_alertlog\_tail.conf

## Storage directory

- Integrated agent host

In Windows

- For a physical host  
*Agent-path*\conf\sample\

In Linux:

- For a physical host:  
/opt/jplima/conf/sample/

## Description

Sample file of the definition file used to monitor CCMS alerting for SAP system.

Copy sample file (fluentd\_sap\_alertlog\_tail.conf) and change the file name of the copy destination to fluentd\_Log monitoring name\_tail.conf if required. For the location of the files, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*. This definition file is created for each script specified by Script exporter configuration file (jpc\_script\_exporter.yml).

Lines that start with a "#" are treated as comments and do not affect program operation.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

When Fluentd service restarts, it is reflected in Fluentd operation.

When a definition file is added or deleted, or the value in the [Metric Settings] section is changed, the changes are reflected in integrated operation viewer tree view.

For the reflection method, see *1.21.2(19) Creation and import IM management node tree data (for Windows) (mandatory)* in the *JP1/Integrated Management 3 - Manager Configuration Guide*.

## Information that is specified

See the description of *Information that is specified* in [Monitoring text-formatted log file definition file \(fluentd\\_@@trapname@@\\_tail.conf.template\)](#).

If you want to use this sample file, you must modify the following settings to suit your needs.

| Setting item                                                            | Initial value        | Information that is specified                                                                                                                                                  |
|-------------------------------------------------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path of the monitored log file                                          | @@sap_logpath@@      | Specify the path of the text file specified by the user in the environment parameter setting file to output the extraction result of CCMS alert information of the SAP system. |
| SAP instance name from which you want to extract CCMS alert information | @@sap_instancename@@ | Specify the SAP instance name to output the extraction result of CCMS alert information of the SAP system.                                                                     |

In addition, JP1 event is issued when a match occurs when SEVERITY is greater than or equal to "Warning". If SEVERITY is specified as "Notice", "Debug", or "Information", no JP1 events are issued and only logged to Fluentd. If SEVERITY is "Notice", "Debug", or "Information" and log monitoring results are to be output as JP1 events, change the definition as shown in the underlined part below.

```
## [Forward Settings]
<match tail.sap_alertlog>
  @type rewrite_tag_filter
  <rule>
    key SEVERITY
    pattern /Notice|Debug|Information|Warning|Error|Critical|Alert|Emergency/
    tag ${tag}.jplevent
  </rule>
  <rule>
    key SEVERITY
    pattern /.*/
    tag ${tag}.outputlog
  </rule>
</match>
```

## ◆ Environment parameters file for jr3slget command (jr3slget.ini)

If you specify an environment parameters file as an argument in the `jr3slget` command, the command extracts the system log information of the SAP system based on the settings in the file.

You create this environment parameters file as a text file.

### Setup procedure

To set up the environment parameters file:

1. Before you edit the environment parameters file, make sure that the `jr3slget` command is not running.
2. To create a new environment parameters file, copy the sample environment parameters file under the name `jr3slget.ini`.

This `jr3slget.ini` becomes the default environment parameters file. The sample file of environment parameters file is as follows:

#### ■ Integrated agent host

In Windows:

- For a physical host:

*Folder-to-extract-the-archive-file<sup>#</sup>-for-SAP-system-monitoring-for-Windows\sap\_windows\command\agtm\evtrap\jr3slget.ini.sample*

#: *Agent-path*\options\sap\_windows\_*VRRSS*.zip

In Linux:

- For a physical host:

*Directory-to-extract-the-archive-file*<sup>#</sup>-for-SAP-system-monitoring-for-Linux/sap\_linux/command/  
agtm/evtrap/jr3slget.ini.sample

#: /opt/jplima/options/sap\_linux\_*VRRSS*.tar.gz

3. Open the jr3slget.ini file.

4. Edit the settings.

The settings in the default environment parameters file are as follows; for details about the settings, see [Settings](#):

```
[CONNECT]
ASHOST=localhost
SYSNR=00
CLIENT=000
USER=CPIC
PASSWD=ADMIN
;LANG=EN
;CODEPAGE=1100

[COMMAND]
;WORKDIR=

[TRACE]
MSGLOG_LEVEL=2
MSGLOG_SIZE=512
MSGLOG_DIR=.
DATALOG_LEVEL=2
DATALOG_SIZE=512
DATALOG_DIR=.

[TARGET]
;SERVER=

[FORMAT]
;COLUMN=<TIME>
;COLUMN=<INSTANCE>
;COLUMN=<USER>
;COLUMN=<PROGRAM>
;COLUMN=<MSGNO>
;COLUMN=<MSGTEXT>

[EXTRACTFILE]
TYPE=WRAP2
NUM=5
SIZE=10240
X2PATH=SYSLOG
```

In the case of an item that begins with a semicolon (;), the setting is disabled by default, because the semicolon indicates that it is a comment line. To enable the setting, remove the semicolon.

5. Save the environment parameters file.

By specifying the `-cnf` option in the `jr3slget` command, you can extract the system log information of the SAP system based on the settings in the environment parameters file.

## Settings

Specify the settings in the environment parameters file in the following format:

```

[section]
label=value
label=value
...
...
[section]
label=value
label=value

```

## Notes

- Do not specify any unneeded characters, such as spaces at the beginning of a line or before and after an equals sign (=).
- The values specified in *section* and *label* are not case-sensitive.
- A line beginning with a semicolon (;) is treated as a comment.

The following tables describe the contents of each section in the environment parameters file. In a table, the *Argument* column indicates the argument that is specified in the `jr3slget` command, if applicable. N/A means that the item cannot be specified with the command.

## CONNECT section

The **CONNECT** section specifies information needed to establish RFC connection with the SAP system at the time of command execution.

Table 2–99: Values permitted in the **CONNECT** section

| Label   | Description                                                                                            | Permitted values                                                                                                                                                                                                                      | Default value | Argument |
|---------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|----------|

| Label    | Description                                                                                           | Permitted values                                                 | Default value | Argument  |
|----------|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|---------------|-----------|
| CODEPAGE | Code page used to convert character codes in the Unicode version of the SAP system at the destination | Value combined with the language in the LANG label <sup>#4</sup> | None          | -codepage |

#1

The user specified in this label must have already been granted the following authorizations:

**Table 2–100: Authorizations required by the user to establish RFC connection with function modules (S\_RFC)**

| Authorization | Description                        | Value                 |
|---------------|------------------------------------|-----------------------|
| RFC_TYPE      | Type of RFC object to be protected | FUGR (function group) |
| RFC_NAME      | RFC name to be protected           | *                     |
| ACTVT         | Activity                           | 16 (execution)        |

**Table 2–101: Authorizations required for use of external management interfaces (S\_XMI\_PROD)**

| Authorization | Description                                  | Value   |
|---------------|----------------------------------------------|---------|
| EXTCOMPANY    | Company name of the external management tool | HITACHI |
| EXTPRODUCT    | Program name of the external management tool | JP1     |
| INTERFACE     | Interface ID                                 | XAL     |

You can use the following user types for the user specified in this label:

- Dialog
- System
- Communication
- Service

#2

Specify the PASSWD label if the SAP system is applying conventional password rules. Specify the PASSWD2 label if the SAP system is applying extended password rules. The PASSWD and PASSWD2 labels are mutually exclusive.

#3

A user's password or extended password that is used for establishing connection must consist of single-byte numeric characters (from 0 to 9), single-byte alphabetic characters (from a to z, A to Z), and the following single-byte symbols:

!, @, \$, %, &, /, (, ), =, ?, ', `\*, +, ~, #, -, \_, ., :, {, [, ], }, <, >, |

#4

Set the LANG and CODEPAGE labels in the applicable combination shown below. If any other combination of language and code page is specified, an encoding error might occur in the information acquired from the SAP system.

**Table 2–102: Combination of language and code page specifications**

| Connection-target SAP system | Connection language | Language (LANG) | Code page (CODEPAGE)                                          |
|------------------------------|---------------------|-----------------|---------------------------------------------------------------|
| Unicode version              | Japanese            | JA              | 8000                                                          |
|                              | English             | EN              | No need to specify. If you specify a code page, specify 1100. |

| Connection-target SAP system | Connection language | Language (LANG) | Code page (CODEPAGE)                                          |
|------------------------------|---------------------|-----------------|---------------------------------------------------------------|
| Non-Unicode version          | Japanese            | JA              | No need to specify. If you specify a code page, specify 8000. |
|                              | English             | EN              | No need to specify. If you specify a code page, specify 1100. |

If you omit specification of the LANG label, the user language defined in the connection-target system is assumed.

If you omit specification of the CODEPAGE label, the default code page in the connection-target system is assumed.

## COMMAND section

The COMMAND section specifies information about the work directory for the `jr3slget` command.

Table 2–103: Values permitted in the COMMAND section

| Label   | Description                    | Permitted values                                                                                                                            | Default value     | Argument |
|---------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------|
| WORKDIR | Work directory for the command | 1 to 255 single-byte alphanumeric characters. If a relative path is specified, it is treated as the path relative to the current directory. | Current directory | N/A      |

## TRACE section

The TRACE section specifies information about the message log and data log that store the history of system log information extraction.

Table 2–104: Values permitted in the TRACE section

| Label         | Description                                                                                                                                                                                                                                                 | Permitted values                                                                                                                                                                                                                                   | Default value                                                                                                                    | Argument |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------|
| MSGLOG_LEVEL  | Message log collection level for saving application trace information: <ul style="list-style-type: none"> <li>0: Do not collect</li> <li>1: Collect only errors</li> <li>2: Standard</li> <li>3: Details</li> <li>4: Debug</li> </ul>                       | 0-4                                                                                                                                                                                                                                                | 2                                                                                                                                | N/A      |
| MSGLOG_SIZE   | File size for collecting the message log: <ul style="list-style-type: none"> <li>0: 2 GB (the maximum value that can be expressed by a 32-bit signed integer (0x7FFFFFFF))</li> <li>1-65535: Wraparound within the specified size (in kilobytes)</li> </ul> | 0-65535                                                                                                                                                                                                                                            | 512                                                                                                                              | N/A      |
| MSGLOG_DIR    | Message log file ( <code>jr3slget.log</code> ) collection-target directory                                                                                                                                                                                  | 1-255 single-byte alphanumeric characters. The total length, including file name <code>jr3slget.log</code> , must not exceed 255 bytes. If a relative path is specified, it is treated as the path relative to the work directory for the command. | Work directory for the command (or the current directory if it has not been changed by the WORKDIR label in the COMMAND section) | N/A      |
| DATALOG_LEVEL | Data log collection level for saving various types of data information for applications:                                                                                                                                                                    | 0-4                                                                                                                                                                                                                                                | 2                                                                                                                                | N/A      |

| Label        | Description                                                                                                                                                                                                                                              | Permitted values                                                                                                                                                                                                                     | Default value                                                                                                                    | Argument |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------|
|              | <ul style="list-style-type: none"> <li>0: Do not collect</li> <li>1: Collect only errors</li> <li>2: Standard</li> <li>3: Details</li> <li>4: Debug</li> </ul>                                                                                           |                                                                                                                                                                                                                                      |                                                                                                                                  |          |
| DATALOG_SIZE | File size for collecting the data log: <ul style="list-style-type: none"> <li>0: 2 GB (the maximum value that can be expressed by a 32-bit signed integer (0x7FFFFFFF))</li> <li>1-65535: Wraparound within the specified size (in kilobytes)</li> </ul> | 0-65535                                                                                                                                                                                                                              | 512                                                                                                                              | N/A      |
| DATALOG_DIR  | Data log file (jr3slget.dat) collection-target directory                                                                                                                                                                                                 | 1-255 single-byte alphanumeric characters. The total length, including file name jr3slget.dat, must not exceed 255 bytes. If a relative path is specified, it is treated as the path relative to the work directory for the command. | Work directory for the command (or the current directory if it has not been changed by the WORKDIR label in the COMMAND section) | N/A      |

## TARGET section

The TARGET section specifies information that identifies the system log information to be extracted.

Table 2–105: Values permitted in the TARGET section

| Label  | Description                                                                                                             | Permitted values                            | Default value | Argument |
|--------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|---------------|----------|
| SERVER | SAP instance name (the SAP instance name that has a dialog service, and which can be verified by transaction code SM51) | 1 to 20 single-byte alphanumeric characters | None          | -server  |

## FORMAT section

The FORMAT section specifies the output format of the system log information.

Table 2–106: Values permitted in the FORMAT section

| Label  | Description                             | Permitted values                                                                                      | Default values                                                                                                                  | Argument |
|--------|-----------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|----------|
| COLUMN | Output format of system log information | Field ID. For details about the field ID, see <i>jr3slget</i> command in <i>Chapter 1. Commands</i> . | Column 1: <TIME><br>Column 2: <INSTANCE><br>Column 3: <USER><br>Column 4: <PROGRAM><br>Column 5: <MSGNO><br>Column 6: <MSGTEXT> | N/A      |

## EXTRACTFILE section

The EXTRACTFILE section specifies information about the output file for the system log information.

Table 2–107: Values permitted in the EXTRACTFILE section

| Label  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Permitted values                                                                                                                                                                                                                                                                           | Default value |

Legend:

--: Not applicable

#1

If the WRAP1 format is used, a management file having the name *storage-file-name*.ofs is created in the same directory as for the storage file.

Example:

If SYSLOG is specified as the storage file name, a management file named SYSLOG.ofs is created in addition to the SYSLOG file.

If you delete the storage file, you must also delete the management file.

#2

If you do not use the default storage location, the storage and management files will not be collected when you use the `jpcras` command. Therefore, in the event of a problem, you need to manually collect the storage and management files.

#3

A value in the range specified in the `NUM` label (default: 1 through 5) is assigned to this value to obtain the file name.

#4

If a relative path is specified, the command's working directory (directory specified in the `WORKDIR` label in the `COMMAND` section) is assumed as the current directory. If no working directory is specified, the directory listed below is assumed as the current directory.

## Option section

The `Option` section specifies information that determines the base point for system log extraction.

You can set a time zone for the SAP system by editing the `SAPTIMEZONEOFFSET` setting in the `Option` section of the environment parameters file to which the system log information extraction function refers. By editing the `SAPTIMEZONEOFFSET` setting, you can correctly extract system log information even when the host on which JP1/IM - Agent is running and the SAP system use different time zones. If you do not set a label in this section, the default value is used.

For details about the recommended collection base time for remote monitoring, see [Notes on the collection base time](#). For details about the precautions to be observed when setting a time zone for the SAP system, see [Notes on the SAP system time zone](#).

Table 2–108: Values permitted in the `Option` section

| Label                                        | Description                                                                                                                                                                                                                                                                                                                                   | Permitted value           | Default value                                                                                                                                     |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SHIFTEXTRACTTIME</code> <sup>#1</sup>  | The collection base time (units: seconds) that determines the base point for extracting system log information.<br><br>Relative to the time at which to perform the collection, specify a value that indicates the amount of time by which to shift the time period (defined by two time points) for which to extract system log information. | 0-600                     | 5                                                                                                                                                 |
| <code>SAPTIMEZONEOFFSET</code> <sup>#2</sup> | When the host on which JP1/IM - Agent is running and the SAP system use different time zones (including the case where one adopts daylight saving time while the other does not), set a time difference between the SAP system time zone and UTC (units: minutes).                                                                            | -1440-+1440 <sup>#3</sup> | Time zone of the host on which JP1/IM - Agent is running.<br><br>For example, when JP1/IM - Agent uses JST (UTC+9) as the time zone, +540 is set. |

#1

When you are to specify 0 or a greater value, you can omit the plus sign (+).

#2

If, due to the processing delay in the SAP system, the saved system log information does not correctly reflect the actual time at which it has arisen, set a value greater than the default value for this label.

#3

Set this label only when the host on which PFM - Agent is running and the one on which the monitored SAP system is running use different time zones in an environment where the remote monitoring function is used.

The following examples show how to set the collection base time and the time zone:

- When 10 seconds is to be set as the collection base time

```
[Option]
SHIFTEXTRACTTIME=10
```

- When UTC (UTC+0) is set as the SAP system time zone and standard time is used

```
[Option]
SAPTIMEZONEOFFSET=0
```

- When EST (UTC-5) is set as the SAP system time zone and daylight saving time (+1 hour) is used

```
[Option]
SAPTIMEZONEOFFSET=-240
```

## Notes

If you change the time zone set for the SAP system (except when such a change is necessitated by the switch between standard time and daylight saving time), you have to delete the file storing the time stamps that are based on the previously set time zone. If the timestamp file specified for the `-lasttime` option of the `jr3slget` command exists, delete it before resuming command execution.

### Notes on the collection base time

Observe the following precautions when setting the collection base time:

- Add the `Option` section and the `SHIFTEXTRACTTIME` label when you create or update the environment parameters file.
- Make adjustments to the collection base time recommended for remote monitoring by taking into account the following concept behind the recommended collection base time:

#### Concept behind the collection base time

Due to processing delay in the SAP system, the saved system log or CCMS alert information may not accurately reflect the actual time at which it arose. In this case, even when the local host is being monitored, some of the system log or CCMS alert information is not extracted, which is the same as what happens when a time delay in the SAP system (time difference between hosts) exceeds the collection base time. To avoid this problem, the default collection base time is set at 5 seconds. When a remote host is to be monitored, the effect of time delay in the SAP system must also be taken into consideration, and therefore 5 more seconds (which gives sufficient margin to accommodate an environment that meets the prerequisite of keeping a time difference between hosts to less than 1 second) is added to the collection base time, with 10 seconds being set as the recommended collection base time.

### Notes on the SAP system time zone

Observe the following precautions when setting a time zone for the SAP system:

- The sample file for the environment parameters file does not contain the `Option` section or the `SAPTIMEZONEOFFSET` label. You have to add them when you create an environment parameters file.
- The system log or CCMS alert information that has arisen in the SAP system can be viewed from the JP1 side only after it is collected after elapse of the time set with `SHIFTEXTRACTTIME`. When changing the recommended `SHIFTEXTRACTTIME` setting, you have to take into account a delay in the collection timing. The following figure shows how the `SHIFTEXTRACTTIME` setting affects the extraction of system log or CCMS alert information.

Figure 2–12: How the SHIFTEXTRACTTIME setting affects the range of information to be extracted

## File

jr3slget.ini.sample

## Storage directory

- Integrated agent host

In Windows:

- For a physical host

**Folder-to-extract-the-archive-file#-for-SAP-system-monitoring-for-Windows** \sap\_windows\command\agtm\evtrap\

#

*Agent-path* \options\sap\_windows\_VVRRSS.zip

In Linux:

- For a physical host

**Directory-to-extract-the-archive-file#-for-SAP-system-monitoring-for-Linux** /sap\_linux/command/agtm/evtrap/

#

/opt/jplima/options/sap\_linux\_VVRRSS.tar.gz

## Description

This is the input file of the jr3slget command used for SAP system monitoring. Since various environmental parameters are predefined, they must be created by the user. The user copies the sample file (jr3slget.ini.sample) and changes the file name of the destination to "*any name.ini*" and uses it.

For details on where to locate the files, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the *JPI/Integrated Management 3 - Manager Overview and System Design Guide*.

Note that the location of the default environment parameters file (the file that the system searches when -cnf option is not specified) is .ini of the command in the current directory when the command is executed.

## Character code

ASCII

## Line feed code

In Linux: LF

## When the definitions are applied

When the command is executed using Script exporter, it is reflected when Script exporter is restarted. If you execute the command in any other way, it will be reflected when you save the file.

## Information that is specified

See *Environment parameters file for jr3slget command (jr3slget.ini)*.

- COMMAND section

- WORKDIR label

The WORKDIR label is set to change the working directory of the command from the default. The user must have created a directory with the path set in the WORKDIR label.

If multiple environment parameters files are created, such as when monitoring a multi-instance SAP system using the SAP system log extract command, a different path must be set for each WORKDIR label.

When Script exporter is used to execute the SAP system log extract command and the following values are set, a log file for the SAP system log extract command, a trace file for the SAP system log extract command, and a trace file for RFC library are output to the directory below, with the path relative to the working directory specified in service definition file of Script exporter.

```
../data/sap/command/jr3slget
```

- EXTRACTFILE section

- TYPE label

If you use the script execution result monitoring function (Fluentd) to monitor output text files, you must specify the output format in WRAP2. When monitoring using the script execution result monitoring function (JP1/Base), it is also recommended to specify WRAP2.

## ◆ Environment parameters file for jr3alget command (jr3alget.ini)

If you specify an environment parameters file as an argument in the `jr3alget` command, the command extracts the CCMS alert information of the SAP system based on the settings in the file.

You create this environment parameters file as a text file.

## Setup procedure

To set up the environment parameters file:

1. Before you edit the environment parameters file, check that the `jr3alget` command is not running.
2. To create a new environment parameters file, copy the sample environment parameters file under the name `jr3alget.ini`.

This `jr3alget.ini` becomes the default environment parameters file. The sample file of environment parameters file is as follows:

■ Integrated agent host

In Windows:

- For a physical host:

*Folder-to-extract-the-archive-file<sup>#</sup>-for-SAP-system-monitoring-for-Windows*\sap\_windows\command\agtm\evtrap\jr3alget.ini.sample  
#: *Agent-path*\options\sap\_windows\_VVRRSS.zip

In Linux:

- For a physical host:

*Directory-to-extract-the-archive-file<sup>#</sup>-for-SAP-system-monitoring-for-Linux*/sap\_linux/command/  
agtm/evtrap/jr3alget.ini.sample  
#: /opt/jplima/options/sap\_linux\_VVRRSS.tar.gz

3. Open the jr3alget.ini file.

4. Edit the settings.

The settings in the default environment parameters file are as follows; for details about the settings, see [Settings: zum06005.tif](#)

In the case of an item that begins with a semicolon (;), the setting is disabled by default, because the semicolon indicates that it is a comment line. To enable the setting, remove the semicolon.

5. Save the environment parameters file.

By specifying the -cnf option in the jr3alget command, you can extract the CCMS alert information of the SAP system based on the settings in the environment parameters file.

## Settings

Specify the settings in the environment parameters file in the following format:

```
[section]
label=value
label=value
...
...
[section]
label=value
label=value
```

## Notes

- Do not specify any unneeded characters, such as spaces at the beginning of a line or before and after an equals sign (=).
- The values specified in *section* and *label* are not case-sensitive.
- A line beginning with a semicolon (;) is treated as a comment.

The following tables describe the contents of each section in the environment parameters file. In a table, the *Argument* column indicates the argument that is specified in the jr3alget command, if applicable. N/A means that the item cannot be specified with the command.

## CONNECT section

The CONNECT section specifies information needed to establish RFC connection with the SAP system at the time of command execution.

Table 2–109: Values permitted in the CONNECT section

| Label    | Description                                                                                            | Permitted values                                                                                                                                                                                                      | Default value | Argument  |
|----------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------|
| ASHOST   | Host name of the connection-target application server (which can be verified by transaction code SM51) | 1 to 100 single-byte alphanumeric characters in one of the following formats: <ul style="list-style-type: none"> <li>Host name specified in the hosts file</li> <li>IP address</li> <li>SAP router address</li> </ul> | localhost     | -h        |
| SYSNR    | System number that can be identified by the connection-target application server host                  | 0-99                                                                                                                                                                                                                  | 00            | -s        |
| CLIENT   | User's client name used for establishing connection                                                    | 0-999                                                                                                                                                                                                                 | 000           | -c        |
| USER     | User name used for establishing connection <sup>#1</sup>                                               | 1 to 12 single-byte alphanumeric characters                                                                                                                                                                           | CPIC          | -u        |
| PASSWD   | User's password used for establishing connection <sup>#2</sup>                                         | 1 to 8 single-byte characters <sup>#3</sup>                                                                                                                                                                           | ADMIN         | -p        |
| PASSWD2  | User's extended password used for establishing connection <sup>#2</sup>                                | 1 to 40 single-byte characters <sup>#3</sup>                                                                                                                                                                          | None          | -p2       |
| LANG     | User language used for connection                                                                      | Japanese and English are supported. 2-byte ISO ID or 1-byte language key that is used in the SAP system: <ul style="list-style-type: none"> <li>Japanese: JA or J</li> <li>English: EN or E</li> </ul>                | None          | -l        |
| CODEPAGE | Code page used to convert character codes in the Unicode version of the SAP system at the destination  | Value combined with the language in the LANG label <sup>#4</sup>                                                                                                                                                      | None          | -codepage |

#1

The user specified in this label must have already been granted the following authorizations:

Table 2–110: Authorizations required by the user to establish RFC connection with function modules (S\_RFC)

| Authorization | Description                        | Value                 |
|---------------|------------------------------------|-----------------------|
| RFC_TYPE      | Type of RFC object to be protected | FUGR (function group) |
| RFC_NAME      | RFC name to be protected           | *                     |
| ACTVT         | Activity                           | 16 (execution)        |

Table 2–111: Authorizations required for use of external management interfaces (S\_XMI\_PROD)

| Authorization | Description                                  | Value   |
|---------------|----------------------------------------------|---------|
| EXTCOMPANY    | Company name of the external management tool | HITACHI |
| EXTPRODUCT    | Program name of the external management tool | JP1     |
| INTERFACE     | Interface ID                                 | XAL     |

You can use the following user types for the user specified in this label:

- Dialog
- System
- Communication
- Service

#2

Specify the `PASSWD` label if the SAP system is applying conventional password rules. Specify the `PASSWD2` label if the SAP system is applying extended password rules. The `PASSWD` and `PASSWD2` labels are mutually exclusive.

#3

A user's password or extended password that is used for establishing connection must consist of single-byte numeric characters (from 0 to 9), single-byte alphabetic characters (from a to z, A to Z), and the following single-byte symbols:

!, @, \$, %, &, /, (, ), =, ?, ', `\*, +, ~, #, -, \_, ., :, {, [, ], }, <, >, |

#4

Set the `LANG` and `CODEPAGE` labels in the applicable combination shown below. If any other combination of language and code page is specified, an encoding error might occur in the information acquired from the SAP system.

Table 2–112: Combination of language and code page specifications

| Connection-target SAP system | Connection language | Language (LANG) | Code page (CODEPAGE)                                          |
|------------------------------|---------------------|-----------------|---------------------------------------------------------------|
| Unicode version              | Japanese            | JA              | 8000                                                          |
|                              | English             | EN              | No need to specify. If you specify a code page, specify 1100. |
| Non-Unicode version          | Japanese            | JA              | No need to specify. If you specify a code page, specify 8000. |
|                              | English             | EN              | No need to specify. If you specify a code page, specify 1100. |

If you omit specification of the `LANG` label, the user language defined in the connection-target system is assumed.

If you omit specification of the `CODEPAGE` label, the default code page in the connection-target system is assumed.

## COMMAND section

The `COMMAND` section specifies information about the work directory for the `jr3alget` command.

Table 2–113: Values permitted in the `COMMAND` section

| Label                | Description                    | Permitted values                                                                                                                            | Default value     | Argument |
|----------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------|
| <code>WORKDIR</code> | Work directory for the command | 1 to 255 single-byte alphanumeric characters. If a relative path is specified, it is treated as the path relative to the current directory. | Current directory | N/A      |

## TRACE section

The `TRACE` section specifies information about the message log and data log that store the history of CCMS alert information extraction.

Table 2–114: Values permitted in the TRACE section

| Label         | Description                                                                                                                                                                                                                                                 | Permitted values                                                                                                                                                                                                                        | Default value                                                                                                                    | Argument |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------|
| MSGLOG_LEVEL  | Message log collection level for saving application trace information: <ul style="list-style-type: none"> <li>0: Do not collect</li> <li>1: Collect only errors</li> <li>2: Standard</li> <li>3: Details</li> <li>4: Debug</li> </ul>                       | 0-4                                                                                                                                                                                                                                     | 2                                                                                                                                | N/A      |
| MSGLOG_SIZE   | File size for collecting the message log: <ul style="list-style-type: none"> <li>0: 2 GB (the maximum value that can be expressed by a 32-bit signed integer (0x7FFFFFFF))</li> <li>1-65535: Wraparound within the specified size (in kilobytes)</li> </ul> | 0-65535                                                                                                                                                                                                                                 | 512                                                                                                                              | N/A      |
| MSGLOG_DIR    | Message log file (jr3alget.log) collection-target directory                                                                                                                                                                                                 | 1 to 255 single-byte alphanumeric characters. The total length, including file name jr3alget.log, must not exceed 255 bytes. If a relative path is specified, it is treated as the path relative to the work directory for the command. | Work directory for the command (or the current directory if it has not been changed by the WORKDIR label in the COMMAND section) | N/A      |
| DATALOG_LEVEL | Data log collection level for saving various types of data information for applications: <ul style="list-style-type: none"> <li>0: Do not collect</li> <li>1: Collect only errors</li> <li>2: Standard</li> <li>3: Details</li> <li>4: Debug</li> </ul>     | 0-4                                                                                                                                                                                                                                     | 2                                                                                                                                | N/A      |
| DATALOG_SIZE  | File size for collecting data log: <ul style="list-style-type: none"> <li>0: 2 GB (the maximum value that can be expressed by a 32-bit signed integer (0x7FFFFFFF))</li> <li>1-65535: Wraparound within the specified size (in kilobytes)</li> </ul>        | 0-65535                                                                                                                                                                                                                                 | 512                                                                                                                              | N/A      |
| DATALOG_DIR   | Data log file (jr3alget.dat) collection-target directory                                                                                                                                                                                                    | 1 to 255 single-byte alphanumeric characters. The total length, including file name jr3alget.log, must not exceed 255 bytes. If a relative path is specified, it is treated as the path relative to the work directory for the command. | Work directory for the command (or the current directory if it has not been changed by the WORKDIR label in the COMMAND section) | N/A      |

## TARGET section

The TARGET section specifies information that identifies the CCMS alert information to be extracted.

Table 2–115: Values permitted in the TARGET section

| Label       | Description                                                     | Permitted values                            | Default values                     | Argument         |
|-------------|-----------------------------------------------------------------|---------------------------------------------|------------------------------------|------------------|
| MONITOR_SET | Monitor set name (for details, see the <code>-ms</code> option) | 1 to 60 single-byte alphanumeric characters | SAP CCMS Technical Expert Monitors | <code>-ms</code> |
| MONITOR     | Monitor name (for details, see the <code>-mn</code> option)     | 1 to 60 single-byte alphanumeric characters | All Monitoring Contexts            | <code>-mn</code> |

## FORMAT section

The `FORMAT` section specifies the output format of the CCMS alert information.

Table 2–116: Values permitted in the FORMAT section

| Label    | Description                                                                                                    | Permitted values                                                                                                                                                                                         | Default values                                                                                                                                                                                                   | Argument |
|----------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| COLUMN   | Output format of CCMS alert information                                                                        | Field ID. For details about the field ID, see <i>Output format and contents of <code>jr3alget</code> in Chapter 1 Commands</i> .                                                                         | Column 1: <ALERTDATE><br>Column 2: <ALERTTIME><br>Column 3: <MTSYSID><br>Column 4: <MTMCNAME><br>Column 5: <OBJECTNAME><br>Column 6: <FIELDNAME><br>Column 7: <VALUE><br>Column 8: <SEVERITY><br>Column 9: <MSG> | N/A      |
| TIMEZONE | Time zone for time information specified in field IDs <ALERTDATE>, <ALERTTIME>, <STATCHGDAT>, and <STATCHGTIM> | <ul style="list-style-type: none"> <li>UTC<br/>Output in UTC (international time standard).</li> <li>LOCAL<br/>Output in the local time at the location of the user who executed the command.</li> </ul> | UTC                                                                                                                                                                                                              | TIMEZONE |

## EXTRACTFILE section

The `EXTRACTFILE` section specifies information about the output file for the CCMS alert information.

Table 2–117: Values permitted in the EXTRACTFILE section

| Label | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Permitted values | Default value |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------|
| TYPE  | Format of file for storing CCMS Alert Information: <ul style="list-style-type: none"> <li>WRAP1<br/>This file is in wraparound format, which means that data is overwritten when the amount of CCMS Alert Information reaches a specified value.</li> <li>WRAP2<br/>This format consists of the number of files specified in the <code>NUM</code> label. When the amount of data in the first file reaches a specified value, new data is written in the second file, starting at</li> </ul> | WRAP1 or WRAP2   | WRAP2         |

| Label  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Permitted values                                                                                                                                                                                                                                                                       | Default value |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
|        | <p>the top, after all existing data is deleted from the second file.</p> <p>When all of the files are full, new data is again written in the first file, starting at the top, after all existing data is deleted from the first file.</p> <p>If you configure a new environment for JP1/IM - Agent, we recommend that you specify WRAP2.</p> <p>If you want to change the format of storage files after you have started system operations, first stop any products monitoring the storage files, and then delete the storage files and their management files<sup>#1</sup>.</p> |                                                                                                                                                                                                                                                                                        |               |

Legend:

--: Not applicable

#1

If the WRAP1 format is used, a management file having the name *storage-file-name*.ofs is created in the same directory as for the storage file.

Example:

If ALERT is specified as the storage file name, a management file named ALERT.ofs is created in addition to the ALERT file.

If you delete the storage file, you must also delete the management file.

#2

If you do not use the default storage location, the storage and management files will not be collected when using the jpcras command. Therefore, in the event of a problem, you need to manually collect the storage and management files.

#3

A value in the range specified in the NUM label (default: 1 through 5) is assigned to this value to obtain the file name.

#4

If a relative path is specified, the command's working directory (directory specified in the WORKDIR label in the COMMAND section) is assumed as the current directory. If no working directory is specified, the directory listed below is assumed as the current directory.

## Option section

The `Option` section specifies information that determines the base point for extracting CCMS alert information. If you do not set a label in this section, the default value is used.

For details about the recommended collection base time for remote monitoring, see [Notes on the collection base time](#).

Table 2–118: Values permitted in the Option section

| Label                          | Description                                                                                                                                                                                                                                                                                                                                   | Permitted value | Default value |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------------|
| <code>SHIFTEXTRACTTIME#</code> | The collection base time (units: seconds) that determines the base point for extracting CCMS alert information.<br><br>Relative to the time at which to perform the collection, specify a value that indicates the amount of time by which to shift the time period (defined by two time points) for which to extract CCMS alert information. | 0-600           | 5             |

#

If, due to the processing delay in the SAP system, the saved CCMS alert information does not correctly reflect the actual time at which it has arisen, set a value greater than the default value for this label.

The following example shows how to set the collection base time:

- When 10 seconds is to be set as the collection base time

```
[Option]
SHIFTEXTRACTTIME=10
```

## Notes on the collection base time

Observe the following precautions when setting the collection base time:

- Add the `Option` section and the `SHIFTEXTRACTTIME` label when you create or update the environment parameters file.
- Make adjustments to the collection base time recommended for remote monitoring by taking into account the following concept behind the recommended collection base time:

### Concept behind the collection base time

Due to processing delay in the SAP system, the saved system log or CCMS alert information may not accurately reflect the actual time at which it arose. In this case, even when the local host is being monitored, some of the system log or CCMS alert information is not extracted, which is the same as what happens when a time delay in the SAP system (time difference between hosts) exceeds the collection base time. To avoid this problem, the default collection base time is set at 5 seconds. When a remote host is to be monitored, the effect of time delay in the SAP system must also be taken into consideration, and therefore 5 more seconds (which gives sufficient margin to accommodate an environment that meets the prerequisite of keeping a time difference between hosts to less than 1 second) is added to the collection base time, with 10 seconds being set as the recommended collection base time.

## ◆ Sample file of environment parameters file for jr3alget command (jr3alget.ini.sample)

### File

jr3alget.ini.sample

### Storage directory

- Integrated agent host

In Windows:

- For a physical host

**Folder-to-extract-the-archive-file#-for-SAP-system-monitoring-for-Windows**\sap\_windows\command\agtm\evtrap\  
#

**Agent-path**\options\sap\_windows\_**VVRRSS**.zip

In Linux:

- For a physical host

**Directory-to-extract-the-archive-file#-for-SAP-system-monitoring-for-Linux**/sap\_linux/command/  
agtm/evtrap/  
#

/opt/jplima/options/sap\_linux\_**VVRRSS**.tar.gz

## Description

This is the input file of the jr3alget command used for SAP system monitoring. Since various environmental parameters are predefined, they must be created by the user. The user copies the sample file (jr3alget.ini.sample) and changes the file name of the destination to "*any name.ini*" and uses it.

For details on where to locate the files, see *Appendix A.4(3) Integrated agent host (Windows)* and *Appendix A.4(4) Integrated agent host (Linux)* in the JP1/Integrated Management 3 - Manager Overview and System Design Guide.

Note that the location of the default environment parameters file (the file that the system searches when -cnf option is not specified) is .ini of the command in the current directory when the command is executed.

## Character code

ASCII

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

If the command is executed using the script exporter, it will be reflected when the script exporter is restarted. If the command is executed by any other method, it will be reflected when the file is saved.

## Information that is specified

See *Environment parameters file for jr3alget command (jr3alget.ini)*.

- COMMAND section

- WORKDIR label

The WORKDIR label is set to change the working directory of the command from the default. The user must have created a directory with the path set in the WORKDIR label.

If multiple environment parameters files are created, such as when monitoring a multi-instance SAP system using the SAP system log extract command, a different path must be set for each WORKDIR label.

When Script exporter is used to execute the SAP system log extract command and the following values are set, a log file for the SAP system log extract command, a trace file for the SAP system log extract command, and a trace file for RFC library are output to the directory below, with the path relative to the working directory specified in service definition file of Script exporter.

```
../data/sap/command/jr3alget
```

#### - EXTRACTFILE section

- TYPE label

If you use the script execution result monitoring function (Fluentd) to monitor output text files, you must specify the output format in WRAP2. When monitoring using the script execution result monitoring function (JP1/Base), it is also recommended to specify WRAP2.

## ◆ Log metrics definition file (fluentd\_*any-name*\_logmetrics.conf)

### Syntax

```
## Input
<worker worker-ids-used-for-the-log-metrics-feature>
  <source>
    @type prometheus
    bind bind-number
    port listening-port-number
    metrics_path metrics-path
  </source>
</worker>

<worker worker-id>
  <source>
    @type tail
    path absolute-path-of-the-log-file-monitored-by-the-log-metrics-feature
    tag user-specified-tag-value
    pos_file ../data/fluentd/tail/user-specified-tag-value.pos
  [
    <parse>
      @type regular-expression-type
      expression regular-expressions-for-log-messages
      time_key time-variable-specified-in-expression
      time_format time_key-format
      types variable-name-specified-in-expression:type
    </parse>
  ]
  </source>

## Output
<match tag-to-which-this-match-applies>
  @type prometheus
  <metric>
    name user-specified-log-metric-name
    type log-metric-type
    desc log-metric-description
    key key-for-determining-which-logs-are-converted-to-log-metrics
    buckets histogram-bucket
```

```
<labels>
  label-key label-value
</labels>
</metric>
</match>
</worker>
```

## File

fluentd\_*any-name*\_logmetrics.conf

An *any-name* can contain half-width alphanumeric characters, hyphens, and underscores. The number of characters that can be specified is from 1 to 30.

## Storage directory

For Windows

When using a physical host

*Agent-path*\jplima\conf\user\

When using a logical host

*shared-folder*\jplima\conf\user\

For Linux

When using a physical host

/opt/jplima/conf/user/

When using a logical host

*shared-directory*/jplima/conf/user/

## Description

The Fluentd metric definition file used to read logs output by the application being monitored and convert them into log metrics. Create and place this file to use the log metrics feature.

In addition, in order to read this file, add an include setting to the log monitoring target definition file (jpc\_fluentd\_common\_list.conf), and specify the name of this file.

## Character encoding

UTF-8 (without BOM)

## Linefeed code

In Windows; CR+LF

In Linux: LF

## Timing in which definitions are reflected

Definitions are reflected in Fluentd behavior when restarting the Fluentd service.

## Content description

### - Input plug-in feature definitions

For details on the input plug-in feature, see *3.15.2(1) Input plug-in capability* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

### - Setup used for Prometheus scraping

Configure settings using the first <source> of the ## Input shown in *Syntax*.

Specify `prometheus` in @type.

#### **bind-number** (optional)

This specifies the binding interface when Prometheus scrapes metrics for this plug-in. If this item does not exist, the value is set to `0.0.0.0` by default.

#### **listening-port-number** (required)

Specify the listening port number `24820` used when Prometheus scrapes metrics for this plug-in. To change the listening port number, specify a different value.

#### **metrics-path** (optional)

This specifies the HTTP endpoint used when Prometheus scrapes metrics for this plug-in. If this item does not exist, the value is set to `/metrics` by default.

The number of characters that can be specified is from 1 to 255 (not including the / at the beginning).

#### **worker-ids-used-for-the-log-metrics-feature** (required)

Specify the worker ID of the worker used in "Setup for a log file to be monitored by the log metrics feature".

To specify a single worker, use <worker worker-id>; to specify a range of multiple workers, use <worker worker-id (minimum value) - worker-id (maximum value)>.

### - Setup for a log file to be monitored by the log metrics feature

Configure settings using the second <source> of the ## Input shown in *Syntax*.

For the first @type, specify `tail`. For the @type under <parse>, specify the *supported range of the log monitoring feature* (either `regexp`, `syslog`, `csv`, `tsv`, `ltsv`, `multiline`, or `none`).

For details on the `tail` and <parse> setup, see *3.15.3(2) Input plug-in functions (Input Plugins)* for the *3.15.3 Log monitoring function by JP1/IM - Agent* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

#### **user-specified-tag-value** (required)

Specify character strings separated by a dot (.). (Example: `myapp.access`)

Character strings can contain lower-case alphabetical characters, numeric characters, and underscores. The number of characters that can be specified is from 1 to 30.

#### **regular-expression-type** (required)

This specifies the format of log files targeted by the log metrics feature when read into Fluentd. The following shows the types that can be specified:

- `regexp`
- `syslog`
- `csv`
- `tsv`
- `ltsv`
- `multiline`
- `none`

***regular-expressions-for-log-messages*** (required or optional)

This setting is only written when the *regular-expression-type* is set to `regexp`. Specify the regular expression of the log message you want to read as the target of the log metrics feature here. Specifications of regular expressions follow Ruby regular expressions.

***variable-name-specified-in-expression*** (optional)

This specifies the variable name used to specify the type of numerical value data extracted in *regular-expressions-for-log-messages*.

***type*** (optional)

This specifies the type of the variable name specified in the *variable-name-specified-in-expression*. The following shows types that can be specified:

- `integer`
- `float`

***worker-id*** (required)

Specify the worker ID to be used to monitor a log file in this `<source>` section from among ***worker-ids-used-for-the-log-metrics-feature*** specified in "*Setup used for Prometheus scraping*".

- Output plug-in feature definitions

For details on the output plug-in feature, see 3.15.2(2) *Output plug-in capability* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

Set these definitions using `## Output` shown in *Syntax*.

`<match tag-to-which-this-match-applies> to </match>` (optional)

In the `match` section, specify a tag to only apply `match` to Fluentd events assigned with the specified tag. If a tag is not specified, `match` is applied to all Fluentd events.

Specified values can contain half-width alphanumeric characters, hyphens, and underscores. The number of characters that can be specified is from 1 to 30.

`<metric> to </metric>`

Configure detailed log metrics settings in the `metric` section. Multiple `metric` sections can be defined for a single `match` section.

***user-specified-log-metric-name*** (required)

This specifies the Prometheus metrics data name.

This must match the regular expression `[a-zA-Z_:[a-zA-Z0-9_:] *`. The number of characters that can be specified is from 1 to 255.

***log-metric-type*** (required)

This specifies the metric type of the log metric in Prometheus (`counter` or `gauge`).

- `counter`

This represents metrics that contain values that increase monotonically. This is suited to expressing the number of requests processed, completed tasks, and the number of errors, among other values.

Cumulative values are only reset when restarting Fluentd.

If the `key` in the definition is empty, the metrics value increases in increments of 1 for each record, regardless of record contents.

For metrics that could have declining values, specify `gauge`.

- `gauge`

This represents metrics that contain values that can increase or decrease. This is suited to expressing temperature values, current memory usage, and the number of simultaneous requests, among other values.

### **log-metric-description** (required)

Enter the description of the log metric specified in the `description` of user-specific metric definitions.

Specified values can contain half-width alphanumeric characters, hyphens, and underscores. The number of characters that can be specified is from 1 to 255.

### **key-for-determining-which-logs-are-converted-to-log-metrics** (required or optional)

This specifies the key for determining targets for conversion to log metrics. If the *log-metric-type* is counter, this is optional. If the *log-metric-type* is gauge, this is required.

The number of characters that can be specified is from 1 to 255.

### **label-key** (optional)

A key can be specified for labels assigned to Prometheus metrics data.

This must match the regular expression `[a-zA-Z_:[a-zA-Z0-9_:]*`. This cannot begin with `__`. The number of characters that can be specified is from 1 to 255.

### **label-value** (optional)

A value can be specified for the label key.

This can be specified using any Unicode characters other than control characters. The number of characters that can be specified is from 1 to 255.

When specifying a character string, the character string is set as the label value as is.

If either the *label-key* or the *label-value* is missing, the label will not be displayed.

The labels section, expressed using `<labels>` and `</labels>`, can be defined separately for both inside and outside the metric section. In addition, multiple labels (label sets including a *label-key* and a *label-value*) can be set. For details on labels, see *Label* and *A higher-level label section and the label section under the metric section in 3.15.2(3)(b) prometheus output plug-in in the JP1/Integrated Management 3 - Manager Overview and System Design Guide 3.15.2 Log metrics by JP1/IM - Agent*.

## **Example of definitions**

```
## Input
<source>
  @type prometheus
  bind '0.0.0.0'
  port 24820
  metrics_path /metrics
</source>

## Extract target log message 1
<source>
  @type tail
  @id logmetrics_counter
  path /usr/lib/WebAppA/ControllerLog/ControllerLog.log
  tag WebAppA.Controller
  pos_file /posfile/WebAppA/ControllerLog.log.pos
  <parse>
    @type regexp
    expression /^(?<logtime>[^\[\]]*) \[(?<loglabel>[^\[\]]*)\] (?<class>[^\[\]]*)
  ) : endpoint "\/register" started. Target record: (?<record_num>\d[^\[\]]*)\.$/
    time_key logtime
    time_format %Y-%m-%d %H:%M:%S
    types record_num:integer
  </parse>
</source>
```

```

## Extract target log message 2
<source>
  @type tail
  @id logmetrics_gauge
  path /usr/lib/WebAppA/GeneralLog/GeneralLog.log
  tag WebAppA.GeneralLog
  pos_file /posfile/WebAppA/GeneralLog.log.pos
  <parse>
    @type regexp
    expression /^(?<logtime>[^\[\]]*) \[(?<Status>[^\]]*)\] CPU Usage is (?<cpuvalue>\d[^\%]*)%.$/
    time_key logtime
    time_format %Y-%m-%d %H:%M:%S
    types cpuvalue:float
  </parse>
</source>

## Output
## Define log metrics 1 and 2
<match WebAppA.ControllerLog>
  @type prometheus
  <metric>
    name logmetrics_request_endpoint_register
    type counter
    desc The request number of endpoint register
  </metric>
  <metric>
    name logmetrics_num_of_registeredrecord
    type counter
    desc The number of registered record
    key record_num
    <labels>
      loggroup ${tag_parts[0]}
      log ${tag_parts[1]}
    </labels>
  </metric>
</match>

## Define log metric 3
<match WebAppA.GeneralLog>
  @type prometheus
  <metric>
    name logmetrics_cpu_usage
    type gauge
    desc the CPU Usage of WebAppA.
    key cpuvalue
    <labels>
      loggroup ${tag_parts[0]}
      log ${tag_parts[1]}
    </labels>
  </metric>
</match>

```

## ◆ Property label definition file (property\_labels.conf)

### Syntax

```
{  
  "character-string-before-replacement":"character-string-after-replacement"  
  ,  
    ...  
  },  
}
```

### File

property\_labels.conf

### Storage directory

For Windows

When using a physical host

*Manager-path*\conf\imdd\plugin\jplpccs\_azure\

When using a logical host

*shared-folder*\jplimm\conf\imdd\plugin\jplpccs\_azure\

For Linux

When using a physical host

/etc/opt/jplimm/conf/imdd/plugin/jplpccs\_azure/

When using a logical host

*shared-directory*/jplimm/conf/imdd/plugin/jplpccs\_azure/

### Description

The definition file used to convert IM management node property values into separate values. Set this to replace the tenant ID with the tenant name in Azure monitoring, for example. This also applies to extended attribute values for JP1 events. This file can be used to replace values in the setup description of each monitoring feature, provided that a corresponding value is available.

### Character encoding

UTF-8 (without BOM)

### Linefeed code

In Windows: CR+LF

In Linux: LF

### Timing in which definitions are reflected

Definitions are reflected in the contents of the integrated operation viewer tree view when the `jddcreatetree` command and the `jddupdatetree` command are executed. Definitions are also reflected when a JP1 event is issued due to the monitoring of Promitor performance data triggering an alert.

## Content description

### *character-string-before-replacement*

Specify the property value you want to replace using 1 to 255 characters, excluding control characters.

Example of written description: Subscription ID

### *character-string-after-replacement*

Specify the property value you want the *character-string-before-replacement* to be replaced with using 1 to 255 characters, excluding control characters.

Example of written description: Subscription name

## ◆ imagent common configuration file (jpc\_imagentcommon.json)

### Format

```

},
"//listen_add": {
    "secondary": {
        "port": JPl/IM agent control base listen port,
        "//jplbase_forward_receive": {
            "port": Listen port for transmission of JPl/Base
        }
    }
}
}
}
}
```

## File

```
jpc imagent.json
```

```
jpc imagent.json.model (model file)
```

## Storage directory

- Integrated agent host

In Windows:

- For a physical host  
*Agent-path*\conf\
- For a logical host  
*shared-folder*\jplima\conf\

In Linux:

- For a physical host  
`/opt/jplima/conf/`
- For a logical host  
`shared-directory/jplima/conf/`

### Description

This configuration file defines operation of imagent of JP1/IM agent control base.

### Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflects when imagent service and imagentaction service restarts.

## Information that is specified

|-------------|--|-------------------------|----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             |  | port                    | Yes      | number | See the description of the top-level port.<br>The default number is the same as the top-level port. Do not duplicate numbers.#                                          |
|             |  | jp1base_forward_receive | Yes      | object | See the description of the top-level jp1base_forward_receive.<br>The default number is the same as the top-level jp1base_forward_receive.<br>Do not duplicate numbers.# |

#

In the initial deployment file, the port and jp1base\_forward\_receive.port values (port numbers) listed under the listen\_add are explanatory text enclosed in double quotation marks. If imagent is started with -imagid option, specify the port number as a number without enclosing it in double quotation marks.

## Notes

- If this file is not accessible, imagentproxy will be stopped abnormally.
- If JSON format is invalid or does not match the type specified, the service is stopped abnormally.

## ◆ imagentproxy configuration file (jpc\_imagentproxy.json)

### Format

```
{
  "port": Listen port,
  "log": {
    "message": {
      "num": Logging sectors
      "size": Max. file size
    },
    "internal": {
      "level": "Logging Level"
      "num": Logging sectors
      "size": Max. file size
    },
    "access": {
      "num": Logging sectors
      "size": Max. file size
    }
  },
  "//listen_add": {
    "secondary": {
      "port": JP1/IM agent control base listen port
    }
  }
}
```

### File

jpc\_imagentproxy.json

jpc\_imagentproxy.json.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This configuration file defines the operation of imagentproxy of JP1/IM agent control base.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflected when imagentproxy services Restart.

## Information that is specified

| Member name |           | Optional | Format | Value to Setup                                                                                                                             |
|-------------|-----------|----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
|             | secondary | Yes      | object | Use this membership when you specify secondary with-imagid option of imagent, imagentproxy, imagentaction. <sup>#</sup>                    |
|             | port      | Yes      | number | See the description of the top-level port.<br>The default number is the same as the top-level port. Do not duplicate numbers. <sup>#</sup> |

#

In the initial deployment file, the port (port numbers) listed under the listen\_add are explanatory text enclosed in double quotation marks. If imagentproxy is started with -imagid option, specify the port number as a number without enclosing it in double quotation marks.

### Notes

- If this file is not accessible, imagentproxy will be stopped abnormally.
- If JSON format is invalid or does not match the type specified, the service is stopped abnormally.

## ◆ imagentaction configuration file (jpc\_imagentaction.json)

### Format

```

"port": Listen port,
"log": {
  "message": {
    "num": Logging sectors
    "size": Max. file size
  },
  "internal": {
    "level": "Logging Level"
    "num": Logging sectors
    "size": Max. file size
  },
  "access": {
    "num": Logging sectors
    "size": Max. file size
  }
},
"//listen_add": {
  "secondary": {
    "port": JPL/IM agent control base listen port
  }
}
}

```

### File

jpc\_imagentaction.json

jpc\_imagentaction.json.model (model file)

## Storage directory

### ■Integrated agent host

In Windows:

- For a physical host  
*Agent-path\conf\*
- For a logical host  
*shared-folder\jplima\conf\*

In Linux:

- For a physical host  
*/opt/jplima/conf/*
- For a logical host  
*shared-directory/jplima/conf/*

## Description

This configuration file defines the operation of imagentaction of JP1/IM agent control base.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Reflects when imagent service and imagentaction service Restart.

## Information that is specified

| Member name |           | Optional | Format | Value to Setup                                                                                                                                                                                                                                                                                                |

|                  |          | Allowed characters are alphanumeric characters, "-" (hyphen), and "_" (underscore). Up to 32 characters can be specified. Category ID starting with "jp1_" cannot be specified.                                                                                                                                                                                                                                   |
| filecategoryName | Yes      | <p>specifies the category name for category ID.</p> <p>Specify a character other than a control character. Up to 32 characters can be specified.</p> <p>If no filecategoryID is specified, this Setup field is ignored. If a filecategoryID is specified and this Setup field is not specified, filecategoryID's Value is Setup.</p>                                                                              |
| updateaction     | Yes      | <p>For Windows, describe the action (command-line) to execute when the definition file is updated at the file destination directory that is the relative path from one layer upper from installed directory.</p> <p>For Linux, describe the action (command-line) to execute when the definition file is updated at the relative path from /opt/.</p> <p>For detail, see ■<i>Description of updateaction</i>.</p> |

### ■Description of updateaction

You can list the commands that is executed after updating File. The maximum length of a command line that can be written is 4096 bytes.

If Execute destination host is a 64-bit Windows and you specify commands that are located in the %WINDIR%\System32 folders or lower, be aware of WOW64 redirection feature.

The following types of commands can be Executed:

#### Hosts that Execute Commands Are Windows

- Execute Format File (.com,.exe)
- Batch File (.bat)
- The scripting File of JP1/Script (.spt) (but the association must be Setup so that .spt File can be Executed)

#### Hosts that Execute Commands Are Linux

- Linux Commands
- Shell scripts

Note that you cannot Execute the following commands:

- Commands that require interaction
- Command to display the screen
- Commands with escape sequences or control codes
- Commands that do not terminate, such as daemons
- Commands that require interaction with the desktop such as Windows Message mechanisms and DDE (for Windows)
- Commands that shutdown OS, such as shutdown and halt

### ■Definition File that can be specified for the user-created definition file list definition file

| Definition File that can be specified                                                                           | What to Execute if File is updated                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Displayed category on GUI |

--: Not applicable

#

It can also be specified if File is Add or Deleted.

## ◆ Definition file property file (jpc\_file\_properties.json)

### Format

```
{
  "filelist":[
    {
      "filename": "File Name",
      "filepath": "File's absolute path",
      "updateaction": "Manipulation for Defining Import",
      "message": "Message"
    }, ...
  ]
}
```

### File

jpc\_file\_properties.json

## Storage directory

Place the definition File that you want to work with in the Get or Refresh functions of the definition File into the compressed zip File.

## Description

This File describes File name, File path, and File import operations for the definition File that are to be manipulated by the acquisition or update functions of the definition File.

## Character code

UTF-8 (without BOM)

## Line feed code

In Windows: CR+LF

In Linux: LF

## When the definitions are applied

Loads a definition when the retrieval or updating function of the definition File is activated.

## Information that is specified

| Item name    | Description                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| filename     | Indicates File.                                                                                                                                                                                                                    |
| filepath     | Destination of File is written in absolute path.<br>If File path (absolute path including File name) exceeds 200 characters, it becomes Error.                                                                                     |
| updateaction | Describes the action (command-line) that should be executed if File is updated.<br>For detail, see ■ <i>Description of updateaction</i> in <i>User-created definition file list definition file (jpc_user_deffile_list.json)</i> . |
| message      | Returns the error message ID and its Message body. If it succeeds, omit this item.                                                                                                                                                 |

## ◆ Environment variable file (any file name)

### Format

```
Environment variable name 1 = Variable Value 1
[Environment-variable-name-2 = Variable Value 2]
:
```

### File

File name is optional.

## Storage directory

### ■Integrated agent host

In Windows:

Any integrated agent host folder<sup>#</sup> where you want to execute commands.

In Linux:

Any integrated agent host directory<sup>#</sup> where you want to execute commands.

#

The directory where Environment variable file is stored is arbitrary, but Environment variable file should not be stored in the directory for JP1/IM. If it is stored, it becomes the object of data collection and backup.

When File manipulation facility is used to operate Environment variable file, Environment variable file is stored in the following directory<sup>#</sup>:

In Windows:

- For a physical host  
*Agent-path*\conf\user\
- For a logical host  
*shared-folder*\jplima\conf\user\

In Linux:

- For a physical host  
/opt/jplima/conf/user/
- For a logical host  
*shared-directory*/jplima/conf/user/

#

When Environment variable file is operated by definition File manipulation function, Environment variable file is stored in the specified Storage directory. This directory is not subject to data collection or backup.

## Description

A File that defines an environment-variable for Execute commands on JP1/IM managed hosts.

When you Execute a command on a JP1/IM managed host with auto Response Action, or manual Response Action in JP1/IM - Manager, you can specify an environment variable as execution environment for that command. Environment variables can be specified by Environment variable file written in the format described here.

You can specify any Environment variable for each command as making Environment variable files(File names are optional).

If Environment variable file is not specified in Windows environment, the command is executed in the system environment variable.

## When the definitions are applied

Environment variable file is referenced when starting the command execution.

## Character code

The encoding of Environment variable file is the character codes of the managed host that Execute the command. For the character codes, see the explanation of the character codes in 3.15.7(1)(e) *Command execution function* in the *JP1/Integrated Management 3 - Manager Overview and System Design Guide*.

## Line feed code

In Windows: CR+LF

In Linux: LF

## Information that is specified

The maximum length of a character string that can be specified in a single line is 1023 bytes. Be sure to insert a line break at the end of each line.

### Environment Variable Name

Specifies the name of the environment variable.

You cannot specify an environment variable that contains a newline character.

### Value

Specifies Value of the environment-variable.

By specifying the system environment variable name here, Value of the system environment variable is inherited.

When specifying a system environment variable, enclose the system environment variable name in "<-" and "->", and then specify "<-variable->".

### Important

- Do not specify a character string other than the format "environment variable name = variable Value". If this operand is specified, the command may terminate abnormally depending on the host-side OS that Execute the command.
- Note that Setup Value will not be encrypted or obfuscated if you include something like proxy Setup as an environment-variable.

## ◆ Configuration file of the logical host new setup command (any-file-name)

### Format

```
immgr.host=hostname
immgr.initial_secret=secret string
immgr.proxy_url=URL of proxies|Empty character
immgr.proxy_user=Proxy authentication ID|Empty character
immgr.proxy_password=proxy's authentication password|Empty character
immgr.imbase_port=20724
immgr.imbaseproxy_port=20725
addon.alertmanager.active=yes|no
addon.blackbox_exporter.active=yes|no
addon.fluentd.active=yes|no
addon.promitor.active=yes|no
addon.prometheus_server.active=yes|no
addon.ya_cloudwatch_exporter.active=yes|no
addon.script_exporter.active=yes|no
addon.vmware_exporter.active=yes|no
addon.node_exporter.active=yes|no
addon.process_exporter.active=yes|no
```

```
addon.windows_exporter.active=yes|no  
addon.web_exporter.active=yes|no  
addon.windows_exporter_hyperv.active=yes|no
```

## File

The file name is optional.

Sample filename is stored in the following path:

For Windows

*JPI/IM - Agent install folder\jplima\conf\jpc\_lhsetup.properties*

For Linux

*JPI/IM - Agent install directory/jplima/conf/jpc\_lhsetup.properties*

## Storage destination directory

For Windows

It can be stored in any folder.

For Linux

It can be stored in any directory.

## Description

Files that can be specified as arguments to the new setup command (`jimalhsetup` command) for logical hosts and that allow you to customize the setup settings.

## Character code

UTF-8 (without BOM)

## Line feed code

For Windows: CR+LF

For Linux: LF

## Time of import of definitions

This is reflected when the new setup command (`jimalhsetup` command) for the logical host is executed.

## Description

Table 2–119: : Items set for configuration file membership

| Member name          | Whether or not to omit | Sample file-value | Value to set                                                                                                     |
|----------------------|------------------------|-------------------|------------------------------------------------------------------------------------------------------------------|
| immgr.host           | Not possible           | Empty character   | Specifies the host name of the Integration Manager host to connect to. Specify a host name that can be resolved. |
| immgr.initial_secret | Not possible           | Empty character   | Specify initial secret issued on the Integration Manager host to which you want to connect.                      |

| Member name                         | Whether or not to omit | Sample file-value | Value to set                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     |                        |                   | For initial secret, see 3.15.7(1)(b) <i>Authentication with initial secret</i> in the <i>JP1/Integrated Management 3 - Manager Overview and System Design Guide</i> .                                                                                                                                                                                                                                                           |
| immgr.proxy_url                     | Not possible           | Empty character   | Specifies URL of the proxy server when connecting to the Integration Manager host through a proxy.<br>Use the following form.<br><code>http://hostname:port-number (1-65535)</code><br>Specify an empty string if you do not want to connect to the Integration Manager host through a proxy.                                                                                                                                   |
| immgr.proxy_user                    | Not possible           | Empty character   | Specifies authentication ID when connecting to the Integration Manager host through a proxy only if you specify immgr.proxy_url membership.<br>When running through a proxy with authentication, specify authentication ID of the proxy server.<br>Specify an empty character when proxying without a authentication.<br>Do not use this member if you specify an empty character for the immgr.proxy_url member.               |
| imagent.proxy_password              | Not possible           | Empty character   | Specifies authentication password when connecting through a proxy to the Integration Manager host only if you specify a immgr.proxy_url membership.<br>When passing through a proxy with authentication, specify authentication password of the proxy server.<br>Specify an empty character when proxying without a authentication.<br>Do not use this member if you specify an empty character for the immgr.proxy_url member. |
| immgr.imbase_port                   | Not possible           | 20724             | Specifies the port number (ranging from 5001 to 65535) of imbase running on the target Integration Manager host.                                                                                                                                                                                                                                                                                                                |
| immgr.imbaseproxy_port              | Not possible           | 20725             | Specifies the port number (ranging from 5001 to 65535) of imbaseproxy running on the target Integration Manager host.                                                                                                                                                                                                                                                                                                           |

#### Note

True or false specification and yes or no specification are not case sensitive.

## ◆ Configuration file of the logical host version upgrade setup command (any-file-name)

### Format

```
addon.vmware_exporter.active=yes|no
addon.web_exporter.active=yes|no
addon.windows_exporter_hyperv.active=yes|no
```

## File

The file name is optional.

Sample filename is stored in the following path:

For Windows

*JPI/IM - Agent install folder\jplima\conf\jpc\_lhupdate.properties*

For Linux

*JPI/IM - Agent install directory/jplima/conf/jpc\_lhupdate.properties*

## Storage destination directory

For Windows

It can be stored in any folder.

For Linux

It can be stored in any directory.

## Description

This file is specified as an argument of the version upgrade setup command (`jimalhupdate` command) for the logical host and is used by the user to customize the setup settings.

## Character code

UTF-8 (without BOM)

## Line feed code

For Windows: CR+LF

For Linux: LF

## Time of import of definitions

This is reflected when the upgrade command (`jimalhupdate` command) for the logical host is executed.

## JP1 Events

This chapter describes the types and attributes of the JP1 events that are issued by JP1/IM.

## 3.1 Attributes of JP1 events

This section describes the attributes of JP1 events. JP1 event attributes are categorized into basic attributes and extended attributes. This section provides a detailed description of each event.

### 3.1.1 Basic attributes

All JP1 events have basic attributes. This subsection provides a detailed description of the basic attributes of JP1 events.

#### Details of the basic attributes of JP1 events

The basic attributes are sometimes identified by prefixing their names with `B.`, such as `B.ID`. When it is necessary to use the prefix `B.`, information to that effect is provided in the manual.

Table 3–1: Basic attributes of JP1 events

| Item                      | Attribute name | Description                                                                                                                                                                                                                                       |
|---------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial number             | SEQNO          | The order in which the JP1 event arrived at this event server, regardless of the source of the JP1 event.                                                                                                                                         |
| Event ID                  | ID             | An 8-byte value that indicates the source application program that issued the JP1 event and the nature of the event.                                                                                                                              |
| Extended event ID         | IDEXT          | Eight hexadecimal characters that indicate the extended part of an event ID                                                                                                                                                                       |
| Type                      | TYPE           | Event type                                                                                                                                                                                                                                        |
| Reason for registration   | REASON         | Reason why this JP1 event was registered in this event server.                                                                                                                                                                                    |
| Source process ID         | PROCESSID      | Process ID of the source application program.                                                                                                                                                                                                     |
| Registered time           | TIME           | Time the JP1 event was registered at the source event server.                                                                                                                                                                                     |
| Arrived time              | ARRIVEDTIME    | Time the JP1 event was registered at the local event server.                                                                                                                                                                                      |
| Source user ID            | USERID         | User ID of the source process. If this is an event from Windows, <code>-1</code> is set.                                                                                                                                                          |
| Source group ID           | GROUPID        | Group ID of the source process. If this is an event from Windows, <code>-1</code> is set.                                                                                                                                                         |
| Source user name          | USERNAME       | User name of the source process.                                                                                                                                                                                                                  |
| Source group name         | GROUPNAME      | Group name of the source process. If this is an event from Windows, a space is set.                                                                                                                                                               |
| Event-issuing server name | SOURCESERVER   | Name of the event server that issued the event. If the event has been forwarded, such as from JP1/Base (agent) to JP1/IM - Manager (site manager) to JP1/IM - Manager (integrated manager), the event server name of the initial JP1/Base is set. |
| Target event server name  | DESTSERVER     | If the source application program explicitly specifies forwarding of the event to another event server, the name of that event server is set.                                                                                                     |
| Source IP address         | SOURCEIPADDR   | IP address of the source event server (this value is not accurate if the transmission was via NAT (network address translation) or a proxy, or if the JP1 event was forwarded because of environment settings).                                   |
| Target IP address         | DESTIPADDR     | IP address of the target event server (this value is not accurate if the transmission was via NAT (network address translation) or a proxy, or if the JP1 event was forwarded because of environment settings).                                   |
| Source serial number      | SOURCESEQNO    | Serial number at the source host (this value is not changed by forwarding).                                                                                                                                                                       |
| Code set                  | CODESET        | Name of the character code set that is used for messages, detailed information, and extended attributes.                                                                                                                                          |

| Item                 | Attribute name | Description                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message              | MESSAGE        | Character string describing the details of the event.                                                                                                                                                                                                                                                                           |
| Detailed information | --             | Any data.<br>Detailed information about basic attributes is usually used by a product that issues events that are compatible with JP1/SES version 5 or earlier in order to record detailed information.<br>Products whose version is 6 or later typically use the JP1 event extended attributes to record detailed information. |

--: None

## 3.1.2 Extended attributes

Extended attributes are attributes that can be specified by a program that issues JP1 events. Extended attributes provide two types of information: common information and program-specific information. Common information is information that is common to all JP1 programs. Program-specific information applies to extended attributes that do not provide common information. This subsection provides a detailed description of common information.

### Details of common information

The extended attributes are sometimes identified by prefixing their names with `E.`, such as `E.SEVERITY`. When it is necessary to use the prefix `E.`, information to that effect is provided in the manual.

The following table lists and describes the common information provided by extended attributes.

Table 3–2: List of common information provided by extended attributes

| Item         | Attribute name | Description                                                                                                                                                                                                                      |
|--------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event level  | SEVERITY       | Severity of the JP1 event. The following values can be assigned (listed here in descending order of severity):<br>Emergency<br>Alert<br>Critical<br>Error<br>Warning<br>Notice<br>Information<br>Debug                           |
| User name    | USER_NAME      | Name of the user executing the job.                                                                                                                                                                                              |
| Product name | PRODUCT_NAME   | Name of the program that issued the JP1 event, such as the following:<br>/HITACHI/JP1/AJS<br>/HITACHI/JP1/FTP<br>/HITACHI/JP1/NETMDM<br>/HITACHI/JP1/NPS<br>/HITACHI/JP1/NT_LOGTRAP<br>/HITACHI/JP1/PAM<br>/HITACHI/JP1/IM/SCOPE |
| Object type  | OBJECT_TYPE    | Name indicating the type of object that resulted in issuance of the event, such as the following:<br>JOB, JOBNET, BATCHJOB, ACTION, LIST                                                                                         |

| Item             | Attribute name   | Description                                                                                                                                                                                                                                                                                                                             |
|------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object name      | OBJECT_NAME      | Name of the object that resulted in issuance of the event (such as the name of a job or a jobnet).                                                                                                                                                                                                                                      |
| Root object type | ROOT_OBJECT_TYPE | Type of object. This is usually the same as the object type, but in the case of an object that has a hierarchical structure, such as a jobnet, this indicates the object type at the highest level of the hierarchy. The permissible values are the same as for the object type.                                                        |
| Root object name | ROOT_OBJECT_NAME | Name used to issue an execution instruction during user operation. This is usually the same as the object name, but in the case of an object that has a hierarchical structure, such as a jobnet, this indicates the name of the object at the highest level of the hierarchy.                                                          |
| Object ID        | OBJECT_ID        | Object ID.<br>Character string that uniquely identifies an object instance within the integrated system when it is combined with PRODUCT_NAME (the format depends on the product; this information is used to call the monitor of each product from the Tool Launcher window of JP1/IM - View).                                         |
| Occurrence       | OCCURRENCE       | Event that occurred in the object indicated by the object name. The events include the following:<br>START (Start of execution)<br>END (End of execution)<br>PAUSE (Pausing execution)<br>RELEASE (Release of temporary stop)<br>RESTART (Start of re-execution)<br>CREATE (Creation of definition)<br>DESTROY (Deletion of definition) |
| Start time       | START_TIME       | Execution or re-execution start time (absolute time in seconds since UTC 1970-01-01 00:00:00). This item might not be set.                                                                                                                                                                                                              |
| End time         | END_TIME         | Execution end time (absolute time in seconds since UTC 1970-01-01 00:00:00). This item might not always be available to set.                                                                                                                                                                                                            |
| Result code      | RESULT_CODE      | Termination code as a decimal character string. This item might not always be available to set.                                                                                                                                                                                                                                         |
| Source host name | JP1_SOURCEHOST   | Name of the source host.                                                                                                                                                                                                                                                                                                                |

## 3.2 JP1 events issued by JP1/IM

This section describes the JP1 events that are issued by JP1/IM.

### 3.2.1 List of JP1 events issued by JP1/IM - Manager

| Event ID               | When issued                                                                                         | Message                                                                                                                                                                                                                                                                                                                                                                                                                           | Function that issues the event                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| 00002010               | When an action's execution time exceeds the action delay monitoring time.                           | KAVB4400-E The run time of an action for an event exceeded the action delay monitoring time. (Event_ID= <i>event-ID</i> , SEQNO= <i>serial-number-in-event-database</i> , Execution Host= <i>action-execution-host</i> , Action Serial Number= <i>action-serial-number</i> ) Delay monitoring notifications will not be sent until suppression of the function for sending notifications to the action delay monitor is canceled. | Automatic Action Service                                                                             |
| 00002011               | When an action is placed in Fail or Error status while the action's status is being monitored.      | KAVB4402-E An event status is abnormal. (event ID = <i>event-ID</i> , event serial number = <i>serial-number-in-event-database</i> , execution host = <i>action-execution-host</i> , action serial number = <i>action-serial-number</i> ) Status monitoring notifications will not be sent until suppression of the function for sending notifications to the action status monitor is canceled                                   | Automatic Action Service                                                                             |
| 00002012               | When the health check function detects an error.                                                    | KAVB8060-E An abnormality was detected in <i>function-name</i> . (host name = <i>host-name</i> , process name = <i>process-name</i> , process ID = <i>process-ID</i> ) : <i>maintenance-information</i>                                                                                                                                                                                                                           | <ul style="list-style-type: none"><li>• Event Console Service</li><li>• Event Base Service</li></ul> |
| 00002013 <sup>#1</sup> | When the health check function detects an error.                                                    | KAVB8062-E An abnormality was detected in <i>function-name</i> . (host name = <i>host-name</i> , process name = <i>process-name</i> ) : <i>maintenance-information</i>                                                                                                                                                                                                                                                            | Event Console Service                                                                                |
| 00002014 <sup>#2</sup> | When the health check function detects error recovery.                                              | KAVB8061-I <i>function-name</i> has been recovered. (host name = <i>host-name</i> , process name = <i>process-name</i> , process ID = <i>process-ID</i> ) : <i>maintenance-information</i>                                                                                                                                                                                                                                        | <ul style="list-style-type: none"><li>• Event Console Service</li><li>• Event Base Service</li></ul> |
